The power required to hold up this fulcrum, measured by the position of the counterpoise on the steelyard which supports it, will give the number of pounds of effort transmitted.

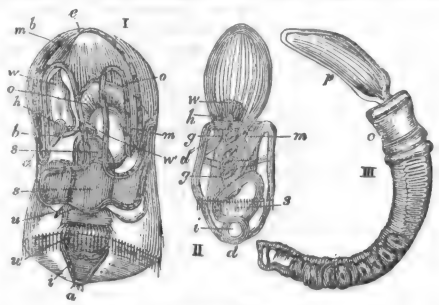
It is related in its mode of development to the echinoderms, in some respects to the ascidians, and is usually classed with the



Balanoglossus.

II. Young balanoglossus. Letters as before, except *g*, the first-formed branchial stigmata. III. Balanoglossus, more advanced. *c*, collar; *p*, proboscis.

Vermes. The members of this genus are elongated, footless, soft-bodied worms, with the mouth at one end of the body and the anus at the other. The fore part of the body presents a kind of collar surrounding a constriction from which springs a long hollow proboscis-like organ, whence the name *Balanoglossus*, this organ being like a tongue somewhat acorn-shaped, proceeding from within the collar like an acorn from its cup. On the portion of the body from which the proboscis springs there is a flattened area with a longitudinal series of branchial apertures, communicating with branchial sacs connected with the alimentary canal; hence the term *Enteropneusta*. In consequence of this relation of the respiratory to the alimentary canal, Huxley associates *Balanoglossus* with *Tunicata* (or ascidians) as members of a pharyngopneustal series. The larval form of *Balanoglossus* was formerly called *Tornaria*, and regarded as an echinoderm from its great resemblance to the larva of a starfish.

From their simple structure, they were formerly thought to be allied to the fungi. There are about 37 known species, grouped into 14 genera, natives of the tropics. They are generally of a

The shell consists of 6 plates, with an operculum of 4 valves. Colonies are to be found on rocks left dry at low water, on ships, on timber, on lobsters and other crustaceans, and on the shells of conchifers and other mollusks. They differ from the members of the genus *Lepas* in having a symmetrical shell and in being destitute of a flexible stalk. They pass through a larval stage of exis-

An ancient military engine used for throwing missiles. The different references to it are contradictory, as it is described as acting by means of a bow, but also as throwing large stones rather than darts. An attempt has been made to reconcile these statements by representing the engine as composed of a strong shaft, rotating on one of its ends, and having at the other end a receptacle for the missile; this shaft would be thrown forward by the recoil of a steel bow, and stopped suddenly against a transom, thus releasing the missile. Throughout the middle ages the term is used in Latin writings for military engines of different kinds. See *trébuchet*, *mangonel*, *petronel*, *pierrier*, and *catapult.* When used as a bearing in heraldry, the ballista is represented so simplified as to be hardly recognizable. It has generally two upright posts with a movable bar between them, shown loaded at one end.

A piece of ordnance is fired against a cast-iron case filled with bags of sand, which forms the ball of a pendulum, and the percussion causes the pendulum to vibrate. The distance through which it vibrates is measured on a copper arc by an index carrying a vernier, and the amount of vibration forms a measure of the force or velocity of the ball. The ballistic pendulum is now nearly superseded by various forms of apparatus for measuring the time occupied by the passage of the shot ★from one screen or wire to another. See *electroballistic.*

The common, non-dirigible balloon, which is spherical in shape, has a valve which can be opened to allow gas to escape and is provided with ballast. If the aëronaut wishes to ascend, he throws out some of the ballast; if to descend, he opens the valve. Balloons of this type have been successfully used for military purposes (see *captive balloon*, below). In the dirigible balloon, which is provided with propelling and steering machinery, the bag is made in various elongated shapes. Balloons of this type have to a certain extent solved the problem of aërial navigation and are likely to be very serviceable for military purposes. See ★*air-ship.*

A method of secret voting by means of small balls, or of printed or written ballots, which are deposited in an urn or a box called a ballot-box. In the former case, each person who is entitled to vote, having the choice of two balls, one white and one black, places a white ball in the box if he is in favor of the resolution proposed, as the admission of a person to membership in a club, or a black ball if he is opposed to it. Hence, to *blackball* a person is to vote against his election. In the latter case, the ballots or voting-papers are so folded as to prevent the voter's preference from being disclosed, and are usually handed to an authorized officer called an inspector of elections, to be deposited in the box in the voter's presence. The ballot is now employed in all popular elections in the United States, throughout the United Kingdom and the British colonies, and in the national or parliamentary elections in Germany, France, Belgium, Italy, and most other countries of continental Europe. On the coasts of South America the name is applied to catamarans or rafts of parallel logs of light wood, such as have been in use since prehistoric times, in which the natives often performed long journeys along the shore either under sail or by oars. In the United States the name had been given to rafts consisting of two or more inflated cylinders of india-rubber or long air-tight casks of metal or wood secured together in pairs by a framework, usually carried by vessels for use as life-rafts, for landing through surf, or in painting a vessel's hull near the water-line. See *balm*.] **1.** An oily, aromatic, resinous substance, exuding from trees of the genus *Balsamea;* hence, by extension, any aromatic or odoriferous exudation from trees or shrubs, whether spontaneous or after incision; balm. A great variety of substances pass under this name; but in chemistry the term is confined to vegetable juices, whether they remain liquid or spontaneously become solid, which consist of resins mixed with gums or volatile oils, the resins being produced from the oils by oxidation. A balsam is thus intermediate between a volatile oil and a resin. It is soluble in alcohol and ether, and capable of yielding benzoic acid. The balsams are either liquid or solid: of the former are the balm of Gilead and the balsams of copaiba, Peru, and Tolu (see below); of the latter, benzoin, dragon's blood, and storax. The balsam used in the Roman Catholic Church in the confection of chrism is, by the rubrics, that of Syria or Mecca; but, from difficulty in obtaining this, concessions have been made by the popes for the use of the balsams of Brazil, Tolu, Peru, etc.

Many of the resins occur in plants dissolved in ethereal oils. Should the vessels which contain this solution be injured, it flows out, and becomes thick, or even solid, on exposure to the air, partly from evaporation of the solvent oil, and partly by its oxidation. Such mixtures of oils and resins are termed *balsams*.

Cf. *babble*.] A child or baby; specifically, a figure of the Child Jesus. It is commonly represented as in the manger at Bethlehem, and is exposed in many Roman Catholic churches throughout the world from Christmas to Epiphany, the effect being often heightened by figures of angels, of the shepherds, of the Magi, etc. The whole together is commonly called in English the *crib*. As a subject of popular devotion, it owes its origin to St. Francis of Assisi in the early part of the thirteenth century. The famous bambino in the church of Ara Cœli at Rome is of olive-wood, and was made in Palestine by a Franciscan lay brother some time before the seventeenth century; it is in repute for miraculous healing, and has been richly decorated by the faithful. In the fine arts this subject has been often treated, notably in the glazed terra-cotta reliefs of Luca della Robbia.

Ind. *bambu*: see *bamboo*.] A genus of arborescent grasses, of the tribe *Bambuseæ* (which see), of about 30 species, natives of southern and eastern Asia, one species only being cosmopolitan. This species, the common bamboo, *Bambos* (*Bambusa*) *Bambos* (*Arundo Bambos* of Linnæus), is nowhere known as indigenous, but is naturalized in many places, and is cultivated extensively in the old world, the West Indies, and South America. Some of the species are spinose at the joints, others are climbers. The stems attain a height of 20, 50, or even 120 feet, with a diameter, in the larger species, of from 4 to 8 inches. The uses that are made of the stems and leaves of the various species of bamboo in the East Indies and eastern Asia are innumerable. Houses and their furniture, the masts, sails, and rigging of ships, rafts, bridges, fences, carts, palanquins, water-pipes, cordage, paper, boxes, baskets, mats, pipe-stems, and in fact nearly all articles of ordinary use, are made entirely or in part from this material. They are mostly confined to the warmer regions of the globe, though some are there found at an altitude of from 10,000 to 15,000 feet above the sea. They are gregarious in habit, and have woody, tall, and often arborescent stems, hollow between the joints, the taller species reaching an extreme height of 120 feet, with a diameter of 6 or 8 inches. Most of the species flower but rarely, but the flowering of any species, when it occurs, is usually general, and the consequent harvest of seed has at times prevented famine in India. The bamboos of tropical America belong to several genera (chiefly *Arthrostylidium*, *Chusquea*, and *Guadua*), some species attaining nearly the size of those of the old world, the genus *Guadua* scarcely differing from *Bambusa*. Several of the Indian genera are berry-bearing, the species most remarkable in this respect being *Melocanna bambusoides*, which produces an edible, fleshy, pear-shaped fruit from 3 to 5 inches long. The same species, as also some others, yields the tabasheer (which see), a secretion in the joints, mainly silicious, which is used as a medicine.

The banking institutions of the United States may be classed as *national* and *State banks*, *savings-banks*, *private banks* or *bankers*, and *loan and trust companies*. National banks were first authorized by a law of the United States enacted in 1863, for a term of twenty years. In 1864 another act was adopted (allowing the like term of twenty years), which was thereafter known as the *National Bank Act*. In 1883 they were authorized to continue for equal periods. They receive, lend, and transmit money, and issue notes which are used as money, and buy, sell, and collect bills of exchange. Their circulating notes are secured by United States bonds deposited with the government, and their operations are subject to the inspection and supervision of the Comptroller of the Currency. State banks perform the same functions except that of issuing notes. The notes of the State banks were taxed 10 per cent. by Congress in 1865, in order to cause their retirement, which was speedily accomplished. Private banks and bankers carry on the same business as State banks. Sometimes one person constitutes a private bank, but generally several persons associate together and form a partnership. Loan- and trust-companies (see ★*trust-company*, in supplement) are incorporated institutions. They do a general banking business and exercise other financial functions, and receive deposits, subject to check or for a fixed period, and loan them on the pledge of stocks, bonds, and other securities, while national and State banks lend largely on the promises of the borrowers; they have also a capital which is subscribed and paid by the stockholders. Savings-banks receive money and lend it chiefly on the security of real estate. See *savings-bank*. In Europe several great national banks are intimately associated with the fiscal departments of the governments of their respective countries, as the Bank of England and the Bank of France. Banks of issue are such as issue notes that circulate as currency.

The office in which the transactions of a banking company are conducted.—**Bank-charter Act**, an English statute of 1844 (7 and 8 Vict., c. 32) defining the powers of the Bank of England in respect to the issue of notes and the amount of bullion reserve. It also regulated the issue of notes by other banks. Also known as the *Peel Act*, and *Sir Robert Peel's Act*.—**Bank discount.** See *discount*.—**Bank men**, in *U. S. hist.*, supporters of the second United States Bank in its contest with President Jackson. Two institutions have been chartered by Congress under the title Bank of the United States, having their seat in Philadelphia, and intimately connected with the national finances. The charter of the first, granted in 1791, expired in 1811, its renewal having been refused. The second lasted from 1816 to 1836 under the national charter, and was continued for a time as a State bank. The opposition of President Jackson to the renewal of its charter, and his removal of the government deposits from it in 1833, led to a violent political contest, in which his course was ultimately sustained.—**Bank of issue**, a bank or banking company duly authorized by law to issue bank-notes of its own.—**Bank post-bill.** See *bill*[3].—**Days in banc.** See *day*[1].—**National Bank Act**, an act of Congress of 1864, providing for the organization throughout the

Among acts of bankruptcy are the assignment of his property by a debtor to a trustee for the benefit of his creditors; the making of a transfer of any of his property in fraud of his creditors, or the concealment or removal of it to evade legal process; departing from the country, or remaining out of it, in order to defeat or delay creditors; the filing in court of a declaration of inability to pay debts; non-payment of debts under certain other circumstances defined by the law as indicating insolvency.—**Assignee in bankruptcy.** See *assignee*.—**Bankruptcy commissioner**, or **register in bankruptcy**, a judicial officer empowered, subject to the supervision of the court, to investigate and adjudicate upon the affairs of bankrupts.—**Bankruptcy laws**, the statutory regulations under which the property of an insolvent may be distributed among his creditors, with the double object of enforcing a complete discovery and an equitable distribution of the property, and of discharging the debtor from his obligations and from future molestation by his creditors. Formerly, only a trader could be made a bankrupt under the bankruptcy laws, other persons who were unable to meet their obligations being *insolvents*. The distinction was abolished in the United States in 1841 and in Great Britain in 1869. In the United States, Congress has the power of enacting bankruptcy laws which shall be uniform throughout the country. These laws are administered by the federal

courts. Laws having similar objects, but less efficacious in respect of discharging the debtor, are maintained by many of the States, but can operate to give a discharge irrespective of creditors' assent only when there is no federal bankruptcy law. These are termed *insolvent laws*. In England bankruptcy laws have existed from the time of Henry VIII. The principal acts are: 34 and 35 Hen. VIII., c. 4, directed against fraudulent debtors, and empowering the lord chancellor and other high officers to seize their estates and divide them among the creditors; 13 Eliz., c. 7, restricting bankruptcy to traders, and prescribing certain acts by committing which a trader became a bankrupt; 4 Anne, c. 17, and 10 Anne, c. 15, removing the criminal character borne by bankruptcy proceedings up to that time, and permitting a debtor to obtain a certificate of having conformed to the requirements of the bankrupt law; 6 Geo. IV., c. 16, allowing a debtor to procure his own bankruptcy, and introducing the principle of private settlements between debtors and creditors; 1 and 2 Wm. IV., c. 56, establishing a court of bankruptcy, consisting of six commissioners along with four judges, as a court of review, and making provision for official assignees. By the Bankrupt Consolidation Act of 1849, proceedings might be begun by petition to the Court of Bankruptcy, and the commissioners were authorized to award certificates according to the merit of the bankruptcy. The bankruptcy act of 1861 (24 and 25 Vict., c. 134) abolished special legislation relating to insolvent debtors, and permitted persons other than traders to avail themselves of the relief afforded by the bankruptcy court. In 1869 (32 and 33 Vict., c. 71) the commissionerships and official assignees were abolished, a new Court of Bankruptcy was established, and provision was made for the appointment of trustees who should be creditors. The Court of Bankruptcy was also stripped of its criminal jurisdiction, and imprisonment for debt was abolished except in certain cases. In 1883 (46 and 47 Vict., c. 52) the English bankruptcy acts were amended and consolidated. Further amendments, in 1890 and 1897, gave preference to the claims for all taxes and rates and for wages. In the United States the subject has been, except during the periods of the operation of the United States bankruptcy acts, left to the imperfect regulation of diverse State laws. Such a law in any particular State may, when there is no United States act conflicting, provide for the distribution of an insolvent's property, may discharge him from imprisonment for debt, and may discharge him, if a citizen of such State, from indebtedness to another citizen thereof contracted while such State law was in force, so far as to make the discharge a protection in the courts of the same State. The first United States bankrupt law, known as the act of 1800 (2 Stat. at L., p. 19), was based on a consolidation of then existing English statutes, and was in force from June 2, 1800, till Dec. 19, 1803. The second, the act of 1841 (5 Stat. at L., p. 440), was in force from Feb. 1, 1842, till March 3, 1843. The third, the act of 1867 (14 Stat. at L., p. 517), repeatedly amended, and finally revised in the U. S. Rev. Stat., tit. LXI., and reënacted with modifications in 1874, was in force from June 1, 1867, till Sept. 1, 1878. A fourth bankrupt law was enacted in 1898, and was amended in 1903. In general, debts contracted by fraud, or in a fiduciary capacity, are not discharged by the bankruptcy laws.—**Commission of bankruptcy**, a commission formerly issued by the English lord chancellor, appointing and empowering certain persons to examine into the facts relative to an alleged bankruptcy, and to secure the bankrupt's property for the creditors.—**Discharge in bankruptcy.** See *discharge*.—**Fiat in bankruptcy.** See *fiat*.—**Fraudulent bankruptcy.** See *fraudulent*.—**Involuntary bankruptcy**, bankruptcy adjudged on the petition of creditors, showing cause why the bankrupt should not be allowed to continue in possession of his assets.—**Voluntary bankruptcy**, bankruptcy adjudged on the petition of the debtor, indicating his desire to surrender his assets and be discharged.= **Syn.** *Insolvency*, etc. See *failure*.

In modern usage, any square flag is termed a *banner* when it bears heraldic devices. The most familiar instance is the royal banner of England, commonly called the royal standard; but other heraldic banners are used in the funeral ceremonies of knights of the Garter and the higher nobility.

Originally the right to display a banner (as distinguished from a pennon) was limited to those who could bring a certain array of followers into the field, and who had also been dubbed or accoutred knight. As the military distinctions of earlier feudalism became confused by the employment of paid soldiers, the right of displaying a banner became more and more a reward for distinguished prowess in battle. After a victory or a notable achievement a banneret elect, carrying his pennon in his hand, was, it is said, conducted between two knights of note, and presented to the king or general, who cut off the point or ends of his pennon, making it square. He was then called a *knight of the square flag*. Also called *knight banneret*.

The white flowers are from 4 to 6 inches broad, and the oblong gourd-like fruit, about a foot in length, is eaten by monkeys, and hence is called *monkey-bread* (which see). The juice of the fruit mixed with sugar is much esteemed as a beverage; and the pulp, which is pleasantly acid, is eaten, and is employed as a remedy in Egyptian dysentery. The dried and powdered mucilaginous bark and leaves are used by the negroes, under the name of *lalo*, on their food, like pepper, to diminish perspiration; and the strong fiber of the bark is made into ropes and cloth. The only other known species of this genus are the Australian sour-gourd or cream-of-tartar tree, *Adansonia Gregorii*, which differs chiefly in its smaller fruit, and the Madagascar baobab, *A. Cf. *Mahound* and *Mammet*.] The imaginary idol or symbol which the Templars were accused of worshiping. By some modern writers the Templars are charged with a depraved Gnosticism, and the word Baphomet has had given to it the signification of baptism of wisdom (as if < Gr. *βαφή*, baptism, + *μῆτις*, wisdom), baptism of fire; in other words, the Gnostic baptism, a species of spiritual illumination. But this and the other guesses are of no value. The word may be a manipulated form of *Mahomet*, a name which took strange shapes in the middle ages.

baptism (bap'tizm), *n.* [< ME. *baptisme* (usually and earlier *baptim, baptym, baptem*), < OF. *baptesme, bapteme, batesme, bateme* (mod. F. *baptême*), < LL. *baptisma*, < Gr. *βάπτισμα*, also *βαπτισμός*, < *βαπτίζειν*, dip or plunge in or under water, sink (a ship), drench, soak, draw (wine) by dipping with a cup; in N. T. and eccl., baptize.] **1.** A sacrament or ordinance of the Christian church, instituted by Christ as an initiatory rite, consisting in the immersion of the person in water, or in the application of water to the person by affusion or by sprinkling, by an authorized administrator, "in the name of the Father, and of the Son, and of the Holy Ghost." The proper signification of the rite, the proper subjects of it, and the proper methods of administering it, are matters of dispute in the Christian church. In Protestant churches it is generally regarded as a symbol of purification, a rite of initiation into the visible church of Christ, and a sign ratifying God's covenant with his people. In the Roman Catholic Church baptism is the sacrament of initiation into the church of Christ, consisting essentially in the application of water to the person baptized by one having the intention of conferring the sacrament, and who pronounces at the same time the words, "N., I baptize thee in the name of the Father, and of the Son, and of the Holy Ghost." The Greek formula, "The servant of God is baptized in the name," etc., is also recognized as valid. In most branches of the church a layman may, in case of necessity, administer baptism. In the Roman Catholic, Greek, and most Protestant churches, infant children are admitted to baptism; but among the various Baptist denominations only those are admitted who give credible evidence of possessing a Christian experience. Among them, also, it is generally performed by immersion, which they regard as the Scriptural mode. This is also the common mode in the Eastern churches; in the Western churches sprinkling or pouring is commonly substituted. The Friends reject all baptism with water, regarding Christian baptism as spiritual only.

> *Baptism* is not only a sign of profession, and mark of difference, whereby Christian men are discerned from others that be not christened, but it is also a sign of Regeneration or New-Birth, whereby, as by an instrument, they that receive *Baptism* rightly are grafted into the Church; the promises of the forgiveness of sin, and of our adoption to be the sons of God by the Holy Ghost, are visibly signed and sealed; Faith is confirmed, and Grace increased by virtue of prayer unto God.
> *Articles of Religion of Ch. of Eng. and Prot. Epis. Ch.*

> We believe in . . . *baptism* to be administered to believers and their children, as the sign of cleansing from sin, of union to Christ, and of the impartation of the Holy Spirit. *Congregational Creed*, 1883.

2. Any ceremonial ablution intended as a sign of purification, dedication, etc.: as, the *baptism* administered by John the Baptist, or that administered to proselytes by the ancient Jews; the *baptism* or christening of bells, ships, and other objects in the Roman Catholic Church, etc.

> The publicans justified God, being baptized with the *baptism* of John. Luke vii. 29.

Baptism for the dead, the baptism of a living person instead of and for the sake of one who has died unbaptized. The performance of such a ceremony, although disapproved by the church, is on record in a number of individual cases among the early Christians, and is also said to have been a custom of several ancient sects, the Ebionites, Marcionites, and others. In modern times it has been revived by the Mormons. This practice has been supposed by many to be alluded to in 1 Cor. xv. 29, but other explanations of the passage have been given.—**Baptism of blood**, martyrdom for the sake of Christ, regarded as supplying the absence of the sacrament of baptism.—**Baptism of desire**, the virtue or grace of baptism received by a person who dies earnestly desiring that sacrament, but unable to obtain it.—**Baptism of fire.** (*a*) The gift or gifts of the Holy Spirit; the grace of baptism considered separately from the outer form. (*b*) Martyrdom.—**Clinic or clinical baptism**, baptism on a sick-bed. In the early church this was allowed only in case of impending death, and was sometimes refused even then, except to persons already candidates. Such baptism was recognized as valid; but a person so baptized was not ordinarily eligible to orders, perhaps because it was judged that fear had induced the reception of the sacrament.—**Conditional baptism** (also called *hypothetical baptism*), in the Roman Catholic and Anglican churches, baptism administered to persons in respect to whom it is doubtful whether they have been baptized or not, or whose known baptism is of doubtful validity. The condition is then regularly inserted in the formula: "If thou art not baptized," etc.—**Private baptism**, baptism conferred in the home or elsewhere, without the ceremonies prescribed for the rite of solemn baptism in the church.—**Seal of baptism.** (*a*) The rite of unction in baptism. (*b*) Same as *baptismal character* (which see, under *baptismal*).

baptismal (bap-tiz'mal), *a.* [< *baptism* + *-al*; = F. *baptismal*.] Pertaining to baptism: as, "the *baptismal* vow," *Hammond*.—**Baptismal character**, a spiritual and indelible mark attaching to the souls of baptized Christians from their reception of the sacrament. This term is used officially by the Roman Catholic Church, and also by theologians of the Greek, Oriental, and Anglican churches, to express the doctrine of those churches that a baptized person can for good or for evil never be as one unbaptized, and that the sacrament cannot be repeated without sacrilege. Also called the *seal*, or the *seal of baptism*. See *baptism*.—**Baptismal name**, the personal or Christian name given at baptism.—**Baptismal regeneration**, the doctrine of the remission of original and actual sin, and the new birth into the life of sanctifying grace, in and through the sacrament of baptism.—**Baptismal shell**, a real shell polished, or a small metal vessel in the shape of a scallop-shell, used to take water from the font and pour it upon the head of the candidate in baptism.—**Baptismal vows**, the promises made at baptism by the person baptized, or by the sponsors in his name.

baptismally (bap-tiz'mal-i), *adv.* In or through baptism; by means of baptism.

> Him the *Baptist* soon descried. *Milton*, P. R., i. 25.

2. [*cap.*] A member or an adherent of one of those Christian denominations which maintain that baptism can be administered only upon a personal profession of Christian faith. Generally, though not always, Baptists are immersionists. This doctrine has been held from a very early age of the Christian church; but the Baptists as a distinct denomination date from the epoch of the Reformation, and were originally called *Anabaptists* by their opponents. In the United States the Baptists owe their origin to Roger Williams, who was originally a minister of the Church of England. The principal Baptist denominations are the *Baptists*, sometimes called *Calvinist Baptists*, from their Calvinistic theology; *Freewill Baptists*, who are Arminian in theology and open communionists in practice; *German Baptists*, popularly called *Dunkers; General Baptists*, a party of English Baptists who are Arminian in theology and hold to a general atonement (opposed to *Particular Baptists*, who are Calvinistic); *Old-School Baptists*, sometimes called *Anti-Mission* or *Hard-Shell Baptists*, from their extreme Calvinism, which leads them to oppose all active measures for the conversion of the world (a sect numbering 40,000); *Seventh-Day Baptists*, who keep the seventh day, instead of the first, as the sabbath; *Six-Principle Baptists*, so called from the six principles which constitute their creed (they practise "laying on of hands," and refuse communion to all who do not); *Disciples of Christ*, also called *Christians* or *Campbellites*, an American denomination growing out of the labors of Alexander Campbell, and separately organized in 1827; *Winebrenerians*, or *Church of God* (organized in 1830 by John Winebrenner), who maintain the washing of feet as an ordinance of perpetual obligation; and *Christians*, or the *Christian Connection*, an American sect of Unitarian Baptists founded about 1800. The Baptists are congregational in polity, and generally Calvinistic or semi-Calvinistic in theology. Those of Great Britain do not generally regard baptism by immersion as a prerequisite to communion, and therefore commune with other churches; but the opposite position is, with few exceptions, adopted by the Baptists of the United States. The former are popularly called *open-communionists*, the latter *close-communionists*.

baptistery, baptistry (bap'tis-tėr-i, -tri), *n.*; pl. *baptisteries, baptistries* (-iz, -triz). In the early Christian church the baptistery was distinct from the church-building, and was situated near its west end; it was generally circular or octagonal in form, and domeroofed. About the end of the sixth century the baptistery began to be absorbed in the church, within which the font was placed, not far from the western door. The detached baptistery was, however, often preserved, especially in Italy; and many such baptisteries still remain in use, as that of St. John Lateran in Rome, and those of the cathedrals of Pisa, Florence, etc. As a separate building the baptistery was often of considerable size and great architectural beauty; that of Florence is 108 feet in external diameter. In the West, baptisteries were in early times commonly dedicated to St. John the Baptist. See *font*[1] and *baptismal*.

1. Any one of the pieces of defensive armor used in medieval Europe to protect the horse. There is no record of any general use of such armor in antiquity or among Oriental peoples, or in the European middle ages before the fifteenth century. Housings of different kinds of stuff, sometimes quilted and wadded in exposed parts, the saddle with its appurtenances, and occasionally a chamfron, were all the defense provided for horses until that time. The piece of armor most commonly used after the chamfron (which see) was the bard of the breast. See *poitrel*. The croupière, or part covering the haunches, was added at the close of the fifteenth century; but after the wars of the Roses the bards reached their fullest development, and the upper part of the body of the horse was covered as completely with steel as the body of his rider. This grain has been cultivated from the very earliest times, when it formed an important article of food, as it still does where other cereals cannot be raised. It is largely employed for feeding animals, but its chief use is in the manufacture of fermented liquors, as beer, ale, and porter, and of whisky. No other grain can be cultivated through so great a range of climate, for it matures in Lapland, Norway, and Iceland, in 65° and 70° north latitude, and at an altitude of 11,000 feet in the Andes and Himalaya. The only cultivated form found wild is the two-rowed or long-eared barley, *H. sativum distichon*, a native of western Asia, but cultivated in prehistoric times, as was also the six-rowed species, winter barley, *H. sativum hexastichon*. Of later origin is the common four-rowed species, spring or summer barley, *H. sativum vulgare*. Fan-shaped barley, also called battledore- or sprat-barley, is now considered only a cultivated form of the two-rowed species. Several varieties of these species are found in cultivation. The grain differs generally from wheat in retaining closely its husks; it is also somewhat less nutritious and palatable as an article of food. See *Hordeum*.—**Caustic barley**, an early name for the seeds of *Schœnocaulon officinale*, called in medicine *sabadilla*, and used as a source of veratrin.—**Mouse, wall, way,** or **wild barley**, *Hordeum murinum*, a grass of little value.—**Patent barley**, the farina obtained by grinding pearl-barley.—**Pearl-barley**, the grain deprived of husk and pellicle and completely rounded by grinding. Ultimate origin unknown. The word seems to have arisen in England. The oldest ME. form, *bernekke*, could be simply 'bare-neck,' with a possible allusion to the large white patches on the bird's neck and head. If this were a popular designation, it could easily, when taken into book-language and Latinized, assume the above and the other numerous corrupt forms (ML. *bernicha*, *bernecha*, *bernescha*, *bernesta*, etc.) in which it appears. The loss of a knowledge of its meaning would assist the growth of the fables connected with the word.] **1.** A species of wild goose, *Anser bernicla* or *Bernicla leucopsis*, also called *barnacle-goose* or *bernacle-goose*. It is one of several species of the genus *Bernicla*, inhabiting the northern parts of Europe, and occasionally appearing as a straggler in North America. It is smaller than the various wild geese of the genus *Anser* proper, has dark-brown or blackish upper parts, and a black neck and head, with large white patches. It is related to the common wild goose of North America, *B. canadensis*, and still more closely to the brent- or brant-goose, *Bernicla brenta*. This bird, which was known in the British islands only as a visitor, became the subject of a curious popular fable, not yet extinct, being believed to be bred from a tree growing on the sea-shore, either from the fruit of the tree or as itself the fruit (hence called *tree-goose*), or from a shell-fish which grew on this tree (see def. 2), or from rotting wood in the water.

Barnacle-goose (*Bernicla leucopsis*).

The name is sometimes extended or transferred to various other cirripeds, as the sessile acorn-shells or sea-acorns of the family *Balanidæ*, such as *Balanus tintinnabulum*. See *Balanus*. This is the usual sense of the word, except in Great Britain.

Huxley, Anat. Invert., p. 256.

3. Anything resembling a barnacle (in sense 2). (*a*) Any anomalous growth or extraneous adhering matter or arrangement tending to impede progress.

The word *branks*, q. v., has a similar meaning, but no connection can be made out. The sense of 'spectacles' easily arises from the original sense; but some connect *barnacles* in this sense with OF. *bericle*, mod. F. *besicle*, eye-glass (< ML. **bericulus*, dim. of *berillus*, *beryllus*, beryl: see *beryl* and *brills*), or with mod. F. dial. *berniques*, spectacles.] **1.** A kind of bit or muzzle used to restrain an unruly horse or ass; now (usually in the plural), an instrument consisting of two branches joined at one end with a hinge, placed on a horse's nose to restrain him while being shod, bled, or dressed.

The internal reform of a party cannot be carried out by corrupt leaders. One of the main objects of the reformers was to break the influence of the latter, and to this they owed their appellation of *barnburners*, their enemies charging them with a readiness to burn the building with the vermin, in default of a less radical means of purification. *H. von Holst*, Const. Hist. (trans), III. 359.

barograph (bar′ō-grȧf), *n.* [< Gr. *βάρος*, weight, + *γράφειν*, write.] A self-registering instrument for recording variations in the pressure of the atmosphere. It is made by attaching to the lever of a counterpoised barometer an arm with a pencil in contact with a sheet of paper, and moved uniformly by clockwork. The result is a continuous trace, whose changes of form correspond to the variations of pressure. In another form a ray of light is made to traverse the upper part of the barometer-tube and fall on a moving ribbon of sensitized paper, the rising and falling of the mercury in the barometer causing the beam of light to be increased or diminished in width, thus showing the changes in the barometer by the continuous photographic record of the paper. In still another form the movement of the mercury-column is used to close an electric circuit and thus report its movements. Also called *barometrograph*.

barometer (ba-rom′e-tėr), *n.* [< Gr. *βάρος*, weight, + *μέτρον*, a measure.] An instrument for measuring the weight or pressure of the atmosphere, invented by Evangelista Torricelli, an Italian mathematician and physicist, in 1643. The simplest form of this instrument is a glass tube over 30 inches long, sealed at one end, and then filled with mercury. When the tube is inverted, with the open end dipping into a cup or cistern of mercury, the column sinks, leaving a vacuum at the top, till the pressure of the atmosphere on each unit of surface of the mercury in the cistern equals the weight of the column in the tube over each unit of surface of the horizontal section at the level of the mercury outside, when the pressure of the column of mercury just balances that of the atmosphere. The rise and fall can be measured on a graduated scale. Barometers of this form are called *cistern barometers*. They are the commonest of rough mercurial barometers. For scientific purposes, the most frequently used is Fortin's barometer, in which the cistern is adjustable, the zero of the scale coinciding with the extremity of an ivory pointer (*a* in second figure) which projects downward from the top of the cistern-box. The bottom of the cistern is made of leather, and by a screw working against a wooden button the mercury can be raised or lowered until its surface just touches the point of the index; this operation must be performed before each observation. The *siphon barometer* consists of a bent tube, generally of uniform bore, having two unequal legs. The longer leg, which must be more than 30 inches long, is closed, while the shorter leg is open; the difference of the levels in the two legs represents the pressure of the atmosphere. The *wheel barometer* usually consists of a siphon barometer having a float resting on the surface of the mercury in the open branch, and a thread attached to the float passing over a pulley, and having a weight at its extremity as a counterpoise to the float. As the mercury rises and falls the thread turns the pulley which moves the index of the dial. The barometer is used in many physical and chemical determinations, but its most ordinary applications are (1) to the prediction of changes in the weather, and (2) to the determination of the elevation of stations above the sea-level.—**Aneroid barometer,** a portable instrument, invented by M. Vidi of Paris, for indicating the pressure of the atmosphere without the use of mercury or other fluid. It is a circular metallic box exhausted of air, whose sides are corrugated diaphragms kept apart by the action of powerful springs. The varying pressure of the atmosphere causes a variation of the distance between the diaphragms, which variation, being multiplied by delicate levers and a fine chain wound around a pinion, actuates an index-pointer which moves over a graduated scale. Bourdon's metallic barometer is an aneroid barometer consisting of a flattened, curved tube, exhausted of air and having one end fixed and the other geared to an index-pointer which traverses a graduated arc. The curvature of the tube is affected by variations in the atmospheric pressure, and the pointer is moved correspondingly on the dial.—**Marine barometer,** a cistern barometer adapted to the conditions of a ship's motion, being suspended by gimbals, and having a stricture in the tube to lessen the oscillations of the mercury.—**Pumping of the barometer,** an unsteadiness in the barometric column, due to a gusty wind.—**Self-registering barometer,** a barograph (which see).—**True height of the barometer,** the height of the barometer corrected to the standard density of mercury (that is, its density at the freezing-point of water), for variations of gravity, for the effect of capillarity, index-error, expansion of the scale, etc. The United States Signal Office also corrects for the elevation of the station above the sea-level. See *atmosphere* and *sympiesometer*.

barometer-gage (ba-rom′e-tėr-gāj), *n.* An apparatus attached to the cylinder of a steam-engine, to a condenser, or to some other chamber in which a more or less perfect vacuum may be formed, to indicate the state of the vacuum. In one form a reversed U-tube has one end plunged in a basin of mercury and the other connected with the vacuum-chamber. Another common form is a U-tube partially filled with mercury, and having one end open to the air and the other connected with the vacuum-chamber. Any exhaustion in the chamber causes the mercury to rise in the leg connected with it and to fall in the other. The fluctuations are noted upon a scale placed between ★the two legs of the tube.

Origin uncertain; by some connected through 'servant' with L. *baro(n-)*, a simpleton, blockhead, dunce.] **1.** In Great Britain, the title of a nobleman holding the lowest rank in the peerage; a member of the baronage: as, *Baron* Arundell of Wardour; a Scotch *baron*. The children of barons have the title "Honorable." Originally the barons, being the feudatories of princes, were the proprietors of land held by honorable service. Hence in ancient records the word *barons* comprehends all the nobility. All such in England had in early times a right to sit in Parliament. Anciently barons were *greater*, such as held their lands of the king *in capite*, or *lesser*, such as held their lands of the greater barons by military service *in capite*. "The present barons are—(1) *Barons by prescription*, for that they and their ancestors have immemorially sat in the Upper House. (2) *Barons by patent*, having obtained a patent of this dignity to them and their heirs, male or otherwise. (3) *Barons by tenure*, holding the title as annexed to land." (*Wharton*.) Formerly, when all barons were not summoned to sit in Parliament, the name of *barons by writ* was given to those who actually were so summoned. Barons in the peerages of Scotland and Ireland have seats in the British Parliament only when elected by their order. See *peer*. The word *baron* was not known in the British isles till introduced from the continent under the Norman princes. The coronet of a baron of England consists of a plain gold circle, with six balls or large pearls on its edge, and with the cap, etc., as in a viscount's.

A title of the judges or officers of the English Court of Exchequer, hence called *barons of the Exchequer*, the president of the court being called *chief baron*.—**3.** In *law* and *her.*, a husband: as, *baron and feme*, husband and wife.—**4.** On the continent of Europe, especially in France and Germany, a member of the lowest order of hereditary nobility: in Germany, same as *Freiherr*.—**Baron of beef,** in *cookery*, two sirloins not cut asunder.—**Barons of the Cinque Ports,** members of the British House of Commons formerly elected, two for each of the seven (originally five) Cinque Ports—Dover, Sandwich, Romney, Hastings, Hythe, Winchelsea, and Rye.

baronet (bar′ọn-et), *n.* [< ME. *baronet*, *baronete* (ML. *baronettus*, F. *baronnet*, G. *baronet*, Russ. *baronetŭ*, after E.), < *baron* + *-et*.] **1†.** A lesser or inferior baron. In this use the word had not the specific sense that it received in the time of James I. "According to Spenser ('State of Ireland'), originally applied to gentlemen, not barons by tenure, summoned to the House of Lords by Edward III.; perhaps to the heirs of barons summoned by writ in their fathers' life-

time. Applied in Ireland to the holder of a small barony. Often synonymous with *banneret.*" *N. E. D.*

He had soe many Barrons in his Parliament, as were able to waigh downe the Cleargye and theyr frendes; the which Barrons, they say, were not afterwardes Lordes, but only *Barronetts*, as sundrye of them doe yet retayne the name. *Spenser*, State of Ireland.

2. A British title of hereditary rank or degree of honor next below that of a baron, and thus not conferring a peerage. A baronet is designated Sir So-and-so, Bart. (Christian name and surname being given), and ranks above all knights except those of the Garter. There is no ceremony of investiture, the title being given by patent. The order was founded by James I. in 1611, professedly to promote the English and Scotch colonization of Ulster, for which each baronet paid £1,080. The original limitation of the order to 200 members was set aside and the payment remitted at an early date. (For the badge of the order, see *badge of Ulster*, under *badge*[1].) The title is abbreviated *Bart.* after a name.—**Baronet's hand**, the bloody hand of Ulster. See *badge of Ulster*, under *badge*[1].—**Baronets of Ireland**, an order of knights baronets founded by James I. of England, in the seventeenth year of his reign (1619), for the same purpose and with the same privileges in Ireland as had been conferred on the order created in England in 1611.—**Baronets of Scotland**, an order instituted by Charles I. of England in 1625. The nominal object was the settlement of Nova Scotia, and patents were granted under the great seal of Scotland, as those of the Ulster baronets had been granted under the great seal of England. After the union of the crowns in 1707 the baronets of Scotland charged their arms with the badge of Ulster, and became baronets of the United Kingdom. The baronets of Scotland are often called Nova Scotia baronets. None have been created since the union.

2. Specifically, in *arch.*, applied to a style of decoration which prevailed in Europe during a great part of the eighteenth century, and may be considered to have begun toward the close of the seventeenth century. It is nearly equivalent to the Louis XV. style, and is distinguished by its clumsy forms, particularly in church architecture, and its contorted ornamentation, made up in great part of meaningless scrolls and inorganic shell-work. Also called, sometimes, the *Jesuit style*, from the many and remarkably ugly examples supplied by churches founded by the Jesuit order. This word is often used interchangeably with *rococo;* but *rococo* is preferably reserved for ornament of the same period, particularly in France, which, though overcharged and inorganic, still retains some beauty and artistic quality; *baroque* implies the presence of ugly and repellent qualities.

Sometimes written *baroco, barocco, barock.*

baroscope (bar′ō-skōp), *n.* [< Gr. *βάρος*, weight, + *σκοπεῖν*, view.] **1.** An arrangement showing to the eye, at a glance, the variations in the weight, or, more properly, the density, of the air. As made by Hooke (1715), it consisted essentially of a large light sphere of glass hermetically sealed and balanced at one end of the lever arm. It was essentially a modification of the so-called 'Cartesian diver.'

2. A piece of physical apparatus used to demonstrate the upward pressure of the air. It consists of a large body of small density attached to the beam of a balance, and exactly balanced by a small weight. When this is placed under the receiver of an air-pump and the air is exhausted, the arm of the balance to which the large body is attached tips down, since the upward pressure now taken from it is greater than that removed from the small counterpoise.

They are heath-like shrubs possessing a strong, heavy odor. There are about 15 species, natives of the Cape of Good Hope. The leaves of several species, especially *P. crenulata* (*Diosma crenulata* of Linnæus), are largely used in medicine under the name *buchu*. The Hottentots when smearing their bodies with grease often add the powdered leaves of *P. pulchella* (*Diosma pulchella* of Linnæus), which give them a smell intolerable to Europeans. See *buchu*.

The wine-barrel was legalized in the reign of Richard III., the others under Henry VIII. Under George III. the barrel of ale or beer for town and country was made 36 gallons. Oil, spirits, tar, and pork were measured by the wine-barrel; vinegar, by the barrel of 34 gallons. A barrel of eels or herrings contained 30 gallons by a statute of Henry VI., but by another of Edward IV. this was made 42 gallons. Salmon and spruce beer were also measured by barrels of 42 gallons. A barrel of beef, wet codfish, or honey contained 32 wine gallons; but honey was sometimes sold by barrels of 42 gallons of 12 pounds each. By a statute of George III., a barrel of fish was made 38 wine gallons; but a barrel of salt pilchards or mackerel measured 50 gallons. In the United States the barrel in liquid measure is commonly 31½ gallons, and for solid substances it is generally a unit of weight, a barrel of flour, for example, being 196 pounds, and a barrel of beef or pork 200 pounds. In Maine a barrel of fish is by law 200 pounds. In Louisiana a barrel in dry measure is 3½ bushels. The bushels vary in different States. On the continent of Europe, previous to the introduction of the metric system, there were many barrels. In each state of Italy the *barile* for wine was a little smaller than that for oil; they were about 30 to 60 liters. The *barril* of Normandy was about 60 Paris pintes. The *baral* of Montpellier was 25⅔ liters; the *barrallon* of Barcelona, 30⅓ liters; the *baril* of Riga, 137¾ liters. The *barrique* was commonly larger than the *baril.* The abbreviation is *bbl.*, pl. *bbls.*

basalt (ba-sâlt' or bas'âlt), *n.* [First in E. as L., *basaltes;* = F. *basalte*, < LL. *basaltes*, a late script error for *basanites:* see *basanite*.] A general name given to dark, basic, volcanic rocks of wide distribution and exhibiting great variation in composition. 'Basalt' is one of the oldest of rock names, and was originally applied to dark lavas homogeneous in appearance, and regarded as simple substances until chemical and microscopical researches revealed their complex character. Rocks of widely different composition are still grouped under this term, although many kinds have received special names. The constituents universally present are augite and magnetite or ilmenite. The most common associated minerals are lime-soda feldspar (plagioclase) and olivin, this variety being often known as *basalt proper* or *common basalt*. In place of plagioclase may occur orthoclase, leucite, or other minerals, and olivin may be absent. Ultra-basic lavas, consisting largely of augite, olivin, and magnetite, are also included under basalt by many petrographers. Basalts exhibit a great variety of textures, the more coarsely crystalline being called *dolerite* and the medium-grained *anamesite*. Basalt displays columnar structure more frequently and in greater perfectness than any other rock. Remarkable formations of columnar basalt occur at the Giant's Causeway on the northeast coast of Ireland, and at Fingal's Cave in the island of Staffa, Scotland.—**Basalt ware,** a kind of stoneware made by Josiah Wedgwood and his successors. It is usually black, colored throughout the paste, and has a dull gloss: hence also called *black ware*. Articles made of it are much admired.

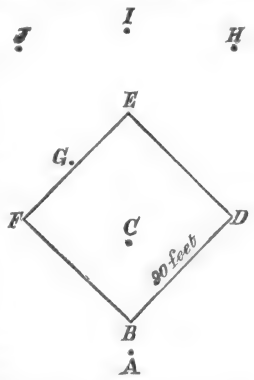
baseball (bās'bâl'), *n.* **1.** A game of ball played by eighteen persons, nine on a side. A square plot of ground called the diamond, with sides 90 feet long, is marked off, at the corners of which are the bases, known as *home* or *home base* (B), *first base* (D), *second base* (E), and *third base* (F). The players on one side take their positions in the field, the *catcher* (A) just behind the home base, the *pitcher* (C) at a distance of 60 feet from the home base on the line from home to second base, the three *basemen* near first, second, and third base, the *short-stop* (G) between second and third, and three *fielders,* known as *right* (H), *center* (I), and *left* (J), at some distance behind and on each side of the second base. The pitcher pitches the ball over the home plate to the catcher. One of the other side, which is said to be *in,* or *at the bat,* takes a position by the home base, and tries to strike the ball as it passes him. If he knocks it into the air, and one of the other side catches it before it reaches the ground, the batter is *out* or retired, that is, retires from the bat, and another takes his place. Should the ball be batted outside the line from home to first or from home to third base continued indefinitely, it is a *foul,* and does not count unless it is caught before it touches the ground, in which case the batter is out. Should it strike inside these lines, the batter runs to first base, and then or later to second, third, and home base. If he reaches home base he scores a *run.* Should the ball be thrown to and caught by a player touching first base before the runner succeeds in reaching it, or should this base-runner be touched with the ball in the hands of any of his adversaries while running from one base to another, he is out.



One player after another of the side which is "in" goes to the bat until three men have been put out. This constitutes half an *inning.* Nine innings make a game unless the score is tied, when extra innings are played until one side wins.

★**2.** The ball with which this game is played.

In the process of triangulation, the angles of these triangles and the length of a single side (the base or base-line) being known, the lengths of all can be computed. In every great survey a number of base-lines are measured, each being from 3 to 10 miles in length.

The holy basil of India, *O. sanctum*, is considered sacred to Vishnu, and rosaries are made of its wood. For the wild, stone, or field basil of Europe, see *basil-weed*. In the United States the name is given to other aromatic labiates, especially to species of *Kœllia*.

The ancients had a curious notion relative to the plant *basil* (O. basilicum), viz., that there is a property in *basil* to propagate scorpions, and that by the smell thereof they are bred in the brains of men.
Quoted in *N. and Q.*, 1st ser., VIII. 40.

He once called her his *basil* plant; and when she asked for an explanation, said that *basil* was a plant which had flourished wonderfully on a murdered man's brains.

basilica[1] (ba-sil'i-kä), *n.* [L., < Gr. *βασιλική*, a basilica, prop. fem. (sc. *στοά*, stoa, or *οἰκία*, house) of *βασιλικός*, royal: see *basilic*. In sense 5 for *basilisk*, 4, *basil*[2].] **1.** Originally, the stoa in which the king-archon dispensed justice in Athens; hence, in *Gr. antiq.*, a frequent distinctive name for a stoa or portico.—**2.** In Rome, where such buildings were introduced about two centuries before Christ, a portico or hall recalling in plan or use the Athenian royal portico. Many of these halls of justice were appropriated for Christian churches, and new churches were built upon a similar plan, whence *basilica* became a usual name for a church. The typical plan of the basilica is an oblong rectangle, with a broad central nave separated from two side-aisles by rows of columns. Over the aisles are galleries. At the extremity of the building furthest from the chief entrance is a raised tribune, where sat originally the Roman pretor or judge and his assessors, and which naturally became the sanctuary of the Christian church. This tribune usually constitutes an apse of the width of the nave, projecting from the main body of the building, and covered with a vault on a semicircular plan. The Christian high altar, which has replaced the throne of the Roman pretor, stands properly in the center of the chord of this apse. Variations from the typical plan are of very common occurrence, such as the absence of an architectural apse; the presence of an apse at each end—a favorite arrangement, especially in early German churches of basilican plan; the duplication of the side-aisles; the carrying of an aisle around the apse; the presence of a transept between aisles and apse, or of minor apses on each side of the chief apse; and many others, often suggested either by accidents of position or by the exigencies of the Christian ritual.

3. Liturgically, in the *Rom. Cath. Ch.*, a title conferred by the pope on a church without reference to its architectural arrangement, and carrying with it certain honors and privileges. In addition to the five major or patriarchal basilicas and the eight minor basilicas at Rome, the title is borne in this sense by other churches in all parts of the world, as the cathedrals of Paris and Rheims in France, and the cathedral of Notre Dame at Quebec.

4†. In the middle ages, a name sometimes given to the elaborate structures raised over important tombs, as that over the tomb or shrine of Edward the Confessor in Westminster Abbey: so called, according to Ducange, because these structures bore a resemblance to diminutive churches.—**5†.** A large piece of ordnance: probably same as *basilisk*, 4.

> The breaching artillery consisted of sixty-three guns, the smallest of which threw a ball of fifty-six pounds, and some few, termed *basilicas*, carried marble bullets of a hundred and twelve pounds weight. *Prescott.*

It consists of yellow wax, black pitch, and resin, of each one part, and of olive-oil four parts. Also called *basilican ointment*.

Basilics (ba-sil'iks), *n. pl.* [E. pl., equiv. to ML. *basilica:* see *Basilica*[2].] Same as *Basilica*[2].

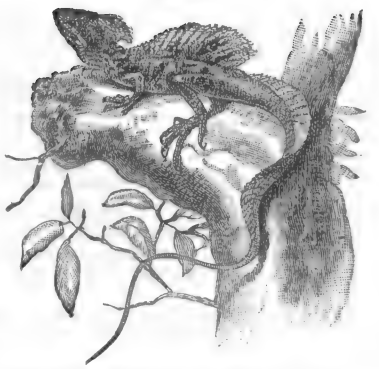
Basilidian (bas-i-lid'i-an), *n.* [< L. *Basilides*, < Gr. Βασιλείδης, a proper name, in form a patronymic, < *βασιλεύς*, king.] A follower of Basilides, a teacher of Gnostic doctrines at Alexandria, Egypt, in the second century. The Basilidians discouraged martyrdom, kept their doctrines as secret as possible, were much given to magical practices, and soon declined from the asceticism of their founder into gross immorality. See *Basilidianism*.

Basilidianism (bas-i-lid'i-an-izm), *n.* [< *Basilidian* + *-ism*.] The doctrines of Basilides and the Basilidians. Basilides taught that from a universal seed-mass containing the germs of all things and created by non-existent Deity (that is, the Absolute) were separated a subtile sonship attaining a place near to but short of the highest by aid of the Holy Spirit, which acts as the firmament separating supermundane things from mundane. A third sonship, that needing purification, remained in the mass, from which also emerged the archons of the ogdoad and hebdomad. See *archon*. The gospel illumination came first to the son of the great archon, who instructed his father. From him it passed to the archon of the hebdomad through his son, and from the hebdomad to Jesus, the son of Mary. The spirit of Jesus ascended at his death to the highest God, leaving his soul in the hebdomad. When the whole of the sonship that remains in this lower world has mounted after Jesus to the highest place, the consummation of all things will come, and an oblivion called the great ignorance will descend on the whole world, even upon the two great archons, that all may remain in their natural place and not aspire after the unattainable. The gospel is the knowledge of these doctrines, and the spiritual are those only who are capable of understanding them. An exceedingly different system, known as *spurious Basilidianism*, was developed among the followers of Basilides. According to this there are 365 generations of angels occupying 365 heavens, each with its own archon, the lowest being the God of the Jews. Christ was the first-born, the Nous or intellect of the highest God, the unbegotten Father. All his work on earth is mere appearance or outward show, a docetic feature found in many earlier heresies.

basiliscine (bas-i-lis'in), *a.* [< L. *basiliscus*, a basilisk, + *-ine*[1].] Pertaining to a basilisk.

basiliscus (bas-i-lis'kus), *n.* [L., a basilisk: see *basilisk*.] **1†.** A basilisk.—**2†.** [NL.] In *ornith.*, an old and disused name of the small crested or golden-crowned wren of Europe, *Regulus cristatus*. It is known in many languages by names corresponding to "little king," as *kinglet*, *roitelet*, *königlein*, *regillo*, *regaliolus*, *regillus*, etc.; also *rex*, *senator*, *presbys*, *trochilus*, *orchillus*, *calendula*, etc. See *Regulus*.

3. [*cap.*] [NL.] A genus of saurian reptiles, or *Lacertilia*, of the family *Iguanidæ* (formerly held to be of greater extent than now), characterized essentially by the presence of a continuous median dorsal crest along the back and tail, erectile at will. There are no femoral pores, and no gular sac, but a dilatable pouch on the head; the dentition is pleurodont. The mitered or hooded basilisk, *B. mitratus*, is especially remarkable for a membranous bag at the back of the head, of the size of a small hen's egg, which can be inflated with air at pleasure, and the function of which is analogous to that of the air-bladder of fishes. The other species have such hoods also, but of a smaller size. To this organ they owe their name, which recalls the basilisk of fable, though in reality they are harmless and exceedingly lively creatures. The species are inhabitants chiefly of Central America and Mexico, and peculiar to America, although one of the *Agamidæ* of Amboyna has been erroneously referred to the genus.



Hooded or Mitered Basilisk (*Basiliscus mitratus*).

basilisk (bas'i-lisk), *n.* and *a.* [Also, until recently, as L., *basiliscus;* < ME. *basilisk* (cf. also *basilicok* and F. *basilic*), < L. *basiliscus*, < Gr. *βασιλίσκος*, a little king, a kinglet (bird), also a kind of serpent, so named from a white spot resembling a crown on the head; dim. of *βασιλεύς*, a king.] **I.** *n.* **1.** A fabulous creature formerly believed to exist, variously regarded as a kind of serpent, lizard, or dragon, and sometimes identified with the cockatrice. It inhabited the deserts of Africa, and its breath and even its look were fatal. In heraldry it is represented as an animal resembling the cockatrice, with its tail terminating in a dragon's head; hence formerly also called *amphisien cockatrice*, as having two heads. See *amphisien*.

> Like as the *Basiliske*, of serpents seede,
> From powrefull eyes close venim doth convay
> Into the lookers hart, and killeth farre away.
> *Spenser*, F. Q., IV. viii. 39.

There is not one that looketh upon his eyes but he dieth presently. The like property has the *basilisk*. A white spot or star it carieth on the head and settith it out like a coronet or diadem. If he but hiss no other serpent dare come near. *Holland*, tr. of Pliny, viii. 21.

2. In *herpet.*, a lizard of the old genus *Basiliscus* (which see) in the widest sense.—**3†.** In *ornith.*, the golden-crested wren or kinglet. See *basiliscus*, 2.—**4†.** A large piece of ordnance: so called from its destructive power. It varied greatly in size and style at different times. In the fifteenth century it is spoken of as throwing stone balls of the weight of 200 pounds, and was therefore of prodigious caliber. D'Aubigné in his History speaks of them as carrying stone balls of 300 pounds, but it is not certain which standard he has in view. In the seventeenth century it was a smaller gun, but still one of the largest then in use. See *basilica*, 5.

> Awake, ye men of Memphis!—hear the clang
> Of Scythian trumpets!—hear the *basilisks*,
> That, roaring, shake Damascus' turrets down!

Basilosauridæ (bas″i-lō-sâ'ri-dē), *n. pl.* [NL., < *Basilosaurus* + *-idæ*.] A family of extinct zeuglodont cetaceans, typified by the genus *Basilosaurus* (or *Zeuglodon*), having the parietal, the frontal, and especially the nasal bones elongated, and the anterior nares opening forward. [According to the rules of zoölogical nomenclature, the operation of the law of priority requires retention of the name, though the creatures were not saurians.]

Basilosaurus (bas″i-lō-sâ'rus), *n.* [NL., < Gr. *βασιλεύς*, king, + *σαῦρος*, lizard.] A genus of large fossil cetaceans from the Eocene of the southern United States. Hence *basinet*.] **1.** A circular dish or vessel of greater width than depth, contracting toward the bottom, and used chiefly to hold water or other liquid, especially for washing, but also for various other purposes.

And say, Will't please your lordship cool your hands?
Shak., T. of the S., Ind., i.

2. As much as a basin will hold; a basinful.—**3.** In the *arts* and *manuf.*: (*a*) In *hat-making*, a vessel filled with boiling water in which the loose mat of felted fur formed on the cone for a hat-body is dipped in the process of basining (see *basin*, *v. t.*), in order to shrink it to the proper size. Also called *sizing-kettle*. (*b*) A concave piece of metal on which glass-grinders form their convex glasses. 8. In *geog.*: (*a*) A depressed part of the earth's surface, occupied by an ocean or lake. (*b*) The area drained by a river. The term is ordinarily used only when speaking of a large river, and then includes the entire area drained by the main stream and its tributaries. (*c*) An area which has no outlet to the sea; a closed basin. In the United States, the *Great Basin* is that portion of the Cordilleran region which has no such outlet, comprising an area of about 225,000 square miles. (*d*) A basin-shaped depression or hollow more or less inclosed by higher land.—**9.** In *geol.*, an area over which the stratified formations are so disposed as to show that they were deposited in succession within a basin-shaped depression of the original surface, thus giving rise to a series of beds which have a general dip toward a common center, especially near the edges of the area. In some instances the basin structure is very marked, as in the case of the Forest of Dean and Inde coal-fields. The geological basins of London and Paris are especially known and interesting. The rocks of both are chiefly Lower Tertiary, or Eocene and Oligocene, the name sometimes given to that part of the series which is intermediate in age between Eocene and Miocene. The important member of the London basin—the "London clay"—is absent from the Paris basin. Many geological basins in the Rocky Mountain region are occupied by fresh-water Tertiary deposits, containing interesting vertebrate fossils, and formerly supposed to mark the sites of extensive lakes: recently a larger proportion of the strata has been regarded as of fluviatile origin. A synclinal fold of strata may be called a basin.

10. In *anat.*: (*a*) The third ventricle of the brain. (*b*) [Cf. F. *bassin* in same sense.] The pelvis.—**11.** In *entom.*, a large concavity in a surface; specifically, a concave portion of the metathoracic segment over the base of the abdomen. The basin of the antenna is a concavity in which the antenna is inserted, often limited on the inner side by a carina, as in the ants.

ly of very simple form, named from its resemblance to a little basin. It was ordinarily worn alone; but in battle the heavy helmet or heaume was placed over it, resting upon the armor of the neck and shoulders. When the heaume came to be abandoned, on account of its great weight, the basinet was furnished with a vizor. It was the commonest form of headpiece during the thirteenth and fourteenth centuries, and so continued until the introduction of the armet. See *helmet*, *vizor*, *aventaile*, *camail*, and *armor*.

By the civil and canon laws (a rule adopted also in many of the United States), a bastard becomes a legitimate child by the marriage of the parents at any future time. But by the laws of England a child, to be legitimate, must at least be born after the lawful marriage; it does not require that the child shall be begotten in wedlock, but it is indispensable that it should be born after marriage, no matter how short the time, the law presuming it to be the child of the husband. The only legal incapacity of a bastard is that he cannot be heir or next of kin to any one save his own issue. Inheritance from the mother is allowed in some jurisdictions. In England the maintenance of a bastard in the first instance devolves on the mother, while in Scotland it is a joint burden upon both parents. The mother is entitled to the custody of the child in preference to the father. In the United States the father may be compelled to provide support.

For the change of *k* to *t,* cf. E. *make*[2] = *mate*[1], and E. *crane* = Dan. *trane,* Sw. *trana,* Icel. *trani.* The AS. name of the bat is *hrēremūs,* > E. *reremouse.* The G. name is *fledermaus;* cf. E. *flittermouse.*] A wing-handed, wing-footed flying mammal, of the order *Chiroptera* (which see). The species are upward of 450 in number, nearly cosmopolitan, but largest, most varied in character, and most abundant in individuals in tropical and subtropical countries. The species of temperate countries, as of the United States and Europe, are comparatively few, small, and of such uniform characters that they give little idea of the extent and diversity of the order in warmer regions. Bats are the most aerial or volitant of all animals, even more so than birds or insects, for they have scarcely any other means of locomotion than flying. They are nocturnal and crepuscular, passing most of the daytime in dusky retreats, where they gather sometimes in almost incredible multitudes, and generally repose hanging head downward by their hind feet. In size they range from less than the size of a mouse to large forms with some five feet spread of wing. The body is usually softly furry; the wings are membranous and naked. The great majority

Hoary Bat (*Lasiurus pruinosus*).

are insectivorous and carnivorous, and constitute the suborder *Animalivora* or *Insectivora;* of these, a few prey upon other bats, and some, of the genera *Desmodus* and *Diphylla,* suck the blood of large animals; but the great bats of South America called *vampires* are chiefly frugivorous. See *Desmodontes, Vampyri.* The old-world fruit-bats, flying-foxes, or roussettes are mostly large species, constituting the family *Pteropodidæ* and suborder *Frugivora.* See cut under *flying-fox.* The physiognomy of many of the bats is grotesque, owing to the extraordinary appendages of the snout, especially in the families *Rhinolophidæ* and *Phyllostomatidæ,* or horseshoe bats and leaf-nosed bats. The ears, too, are often of great size and much complexity of detail, and, like the various appendages of the face, and the wing-membranes themselves, serve as tactile organs of extreme delicacy, even to the extent of sensing objects without actual contact. The wings of bats are commonly given to representations of evil genii and demons, as those of birds are attached to good angels. The large bat represented on Egyptian monuments is one of the fruit-bats, the *Cynonycteris ægyptiaca.* The Hebrew name of the bat of the Old Testament, *atalleph,* is now used in the form *Atalapha* for a genus of American bats. The commonest species of the United States are the small brown bat, *Vespertilio subulatus,* and the red bat, *Lasiurus noveboracensis.* Among European species may be noted the serotine (*Vespertilio serotinus*), the pipistrelle (*V. pipistrellus*), the barbastel (*Barbastellus communis*), the oreillard (*Plecotus auritus*), and the horseshoe bats (*Rhinolophus hipposideros* and *R. ferroquinum*). In heraldry the bat is always represented displayed, that is, with the wings opened, and is often called by its older name *reremouse.*—**Bat's wing,** in *anat.* See *ala vespertilionis,* under *ala.*—**Bat's-wing burner.** See *burner.*—**Bulldog bats,** the molossoid chiropterans. See *Molossus.*—**Harlequin bat.** See *harlequin.*

See *dunging.*—**Knights of the Bath**, an order of knighthood supposed to have been instituted at the coronation of Henry IV. in 1399. The present order of the Bath, however, was instituted by George I. in 1725, as a military order, consisting, exclusive of the sovereign, of a grand master and thirty-six companions. In 1815 the order was greatly extended, and in 1847 it was opened to civilians. It is now composed of three classes, viz.: military and civil knights grand-crosses, G. C. B.; knights commanders, K. C. B.; and knights companions, C. B. The

It is said to be of service in alleviating rheumatism.—**Sour bath**, in *tanning*, an acid liquid made of bran and refuse malt. It is employed to remove the lime used in a previous process, and also to soften the skin to render it more absorbent of the tanning materials.—**Tin-bath**, molten tin covered with melted tallow to prevent the oxidation of the metal. It is used in giving a coating of tin to other metals, as sheet-iron, to form the so-called tin-plate.—**Turkish bath**, a kind of bath introduced from the East, in which the subject, after having undergone copious perspiration in a heated room, is subjected to various processes, as soaping, washing, kneading (shampooing), etc., and ultimately proceeds to an outer apartment, where he is placed on a couch to cool. battering-ram (bat'ėr-ing-ram), *n.* **1.** An ancient military engine consisting of a large beam shod with metal, sometimes with a head somewhat resembling the head of a ram (whence the name), used to batter or beat down the defenses of besieged places. In its simplest form it was carried and forcibly driven against the wall by the hands of the soldiers, but more commonly it was suspended by ropes from a beam which was supported by posts, and balanced so as to swing backward and forward, being in this way impelled against the wall with much more ease and effect. It was also often mounted on wheels and worked under cover, the assailants being protected by a movable shed from the missiles of the besieged.

2. In *law,* the unlawful beating of another. The least degree of violence, or even the touching or spitting in the face of another, in anger or insolence, constitutes a battery. Every battery includes an assault, though an assault does not necessarily imply that it must be such as to threaten a battery. See *assault.*

elect., a voltaic cell, or more properly a number of voltaic cells (see *cell*) arranged together so as to give a powerful current of electricity. The way in which the cells are coupled depends upon the nature of the current which is desired and the relation between the external and internal resistance. (See *resistance.*) For example, if the cells are arranged in series, the copper of the first with the zinc of the next, and so on, the result is to give the maximum electromotive force; on the other hand, if arranged abreast, all the zincs being connected together, and all the copper plates together, the electromotive force is the same as for a single cell, but the internal or battery resistance is diminished, and hence the strength of the current or the quantity of electricity may, under certain conditions, be much increased. The first method is sometimes spoken of in popular language as the arrangement for *intensity,* the second for *quantity.* An early form of battery was *Volta's pile,* and another his *couronne des tasses,* or "crown of cups." The different kinds of battery are named according to the materials or the form of the cells of which they are composed, or the way in which the cells are arranged. Some of the commoner kinds are the *Daniell, Grove, Bunsen, Le Clanché, gravity, bichromate,* etc. For a description of these and others, see *cell.*

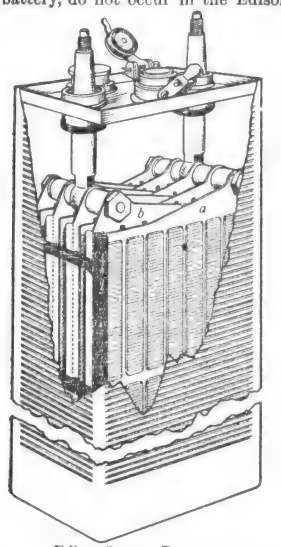
See *galvanic.*—**Grove's gas-battery,** a battery in which the cell consists of two glass tubes partly filled with water, and the remainder with oxygen and hydrogen respectively: in these tubes two platinum electrodes are immersed.—**Horizontal battery,** a battery the interior or terreplein of which is on the natural level of the ground. *Tidball.*—**Indented battery,** or **battery à crémaillère,** a battery constructed with salient and reëntrant angles for obtaining an oblique as well as a direct fire, and to afford shelter from the enfilade fire of the enemy. *Tidball.*—**Joint batteries,** batteries whose fire is directed against the same object.—**Latimer-Clark battery,** an electric battery intended as a standard, the electromotive force being constant. It is a combination of zinc in sulphate of zinc and mercury in sulphate of mercury. *E. H. Knight.*—**Light battery.** (*a*) A mounted field-battery. (*b*) A battery composed of guns of small caliber.—**Magnetic battery.** See *magnetic.*—**Masked battery,** a battery artificially concealed until required to open upon the enemy. *Tidball.*—**Mortar-battery,** a battery having an armament of mortars. Such batteries are constructed with a parapet without embrasures, an interior slope not revetted, but retaining the natural slope of the soil, and platforms horizontal instead of inclining slightly toward the front, as in gun-batteries. See cut on next page.—**Mountain battery,** a battery of light guns, so fitted that the pieces and their carriages may be transported upon the backs of mules or pack-horses.—**Oblique battery,** a battery whose line of fire makes an angle of 20° or more with the

Smooth-bore guns firing spherical projectiles are most effective for ricochet fire.—**Siege-battery,** a battery for siege operations. Such batteries are either *fixed*, comprising siege-guns and mortars of the heaviest caliber and largest size, or *movable*, consisting of field-guns and small mortars.—**Storage battery,** or **secondary battery,** in *elect.*, a combination of secondary cells or accumulators which when once charged may be used for a considerable time after as a source of an electrical current. The Planté type of cell consists of lead plates, usually corrugated or perforated to offer a large surface, and immersed in dilute sulphuric acid. In the Faure type of cell the lead plates are covered with oxid of lead and so the capacity of the cell greatly increased. The cell is charged by sending an electric current through it. By the chemical action of this current the surface of the positive battery plate is converted into brown peroxid of lead, the surface of the negative into gray spongy lead. The chemical energy thus stored up is given back when discharging the cell, in the form of a continuous current, and the surface of the battery plates converted back into oxid of lead. When improperly handled, the cell is destroyed by the formation of sulphate of lead. In the Edison battery the positive plate, *a*, is a perforated nickel-plated steel shell filled with oxid of nickel, the negative, *b*, is a perforated nickel-plated steel shell filled with oxid of iron, and the solution is caustic potash. In charging, the materials are changed respectively into peroxid of nickel and spongy iron. Destructive secondary reactions, as the formation of sulphate in the lead battery, do not occur in the Edison battery.



Edison Storage Battery.

It is useless as a source of a current, because of the high resistance of the water, but, by having a large number of zinc-copper couples, a high and constant difference of potentials is obtained at the two poles; it is thus valuable in many electrostatic experiments.

Battles are classed as *parallel* or *oblique*, according to the relative positions of the contending armies in order of battle; *strategic*, when fought upon an objective point selected in planning a campaign, as were the battles of Marengo and Nashville; *general*, when the whole or the greater part of both armies are engaged; *partial*, when only brigades, divisions, or army corps are brought into action; *offensive*, when an army seeks the enemy and attacks him wherever he is encountered; *defensive*, when a position is selected with the design of awaiting and repelling the enemy; *mixed* or *defensive-offensive*, when an army selects and occupies a position in advance, awaits the approach of the enemy, and at the proper moment moves out to engage him.

Upon the rear sights of the latest military rifles the elevation corresponding to that range is designated by stamping the letter "B" opposite the battle-range elevation. It was introduced into England by William the Conqueror, and practised in three cases only: in the court martial, or court of chivalry or honor; in appeals of felony; and in issues joined upon a writ of right. The contest was held before the judges on a piece of ground inclosed, and the combatants were bound to fight till the stars appeared, unless the death or defeat of one party sooner decided the contest. The weapons used were batons or staves an ell long. Women, priests, men above sixty, and lame and blind persons might appear by champions. Though long fallen into desuetude, it was a valid and legal mode of trial in England down to 1818, and was then formally abolished in consequence of the demand by the defendant in a suit for this mode of arbitrament, and of the fact that this demand could not legally be denied him.=**Syn. 1.** *Battle, Engagement, Conflict, Fight, Combat, Contest, Action.* *Battle* is a general term, and the most common. It is the appropriate word for great engagements: as, the *battle* of Waterloo. A *battle* may last merely a few hours or for days: as, the *battle* of Gettysburg lasted three days. *Engagement* is in technical military usage practically equivalent to *battle*, but it is a less forcible word. *Conflict*, literally, a clashing together, is a strong word, implying fierce physical encounter. *Fight* has the energy of a monosyllable; it denotes actual conflict. A man may take part in a battle without actually fighting. A *battle* may include many *fights*: as, the *fight* at the flagstaff in the *battle* of the Alma; or it may itself be described as a *fight*. *Combat*, like *conflict*, is a word of more dignity than *fight*; it is by its history suggestive of a struggle between two, as persons, animals, squadrons, armies. *Contest* is a very general word, of uncertain strength, but often joined with a strong adjective: as, a stubborn *contest*. An *action* is a minor or incidental act of war, a single act of fighting: as, the whole *action* lasted but an hour. All these words apply equally to operations by land or by sea. See *encounter* and *strife*.

Battlements, although originally purely military, and used from the earliest times in Egypt, Assyria, and Greece, were also employed freely, generally in reduced size, during the middle ages, especially in England, upon ecclesiastical and civil buildings by way of mere ornament, on both parapets and cornices, and on tabernacle-work, transoms of windows, etc.

★**battle-ship** (bat'l-ship), *n.* A ship of war; specifically, a powerful war-ship designed to fight in the line of battle; in recent use, a heavily armored and armed sea-going war-ship intended for the line of battle. The change from the wooden war-ship propelled by sail-power to the modern armored iron and steel steam battle-ship dates from about the middle of the nineteenth century. The first war-ship propelled by a screw was the United States ship Princeton, and the first ironclad (with the exception of a number of floating batteries built by the French for use in the Crimean war, and copied by the English) the French armored wooden frigate La Gloire, launched in 1860. This was followed by the English Warrior, launched in 1861. From this date the development of the war-ship, largely influenced by the success of the monitor (which see), has been very rapid, resulting in a great diversity of types (as regards arrangement and weight of protective armor, character of armament, and adaptation of design to special ends), and accompanied by an equally rapid progress in the perfection of ordnance (see *ordnance, gun*), armor-plate (which see), and explosives. The Warrior, an iron vessel, was of 9,210 tons' displacement, had 4½-inch iron armor, carried 32 muzzle-loading guns, of which the largest were of 8-inch caliber and of small power, and had no torpedo-ejectors; the Arkansas of the United States navy will be of 26,000 tons' displacement; will carry twelve 12-inch guns, twenty-one 5-inch (rapid-fire) guns, four three-pounders, two one-pounders, two 3-inch guns, and two 30-caliber guns; and will have heavy steel armor. See ★*navy.* Modern war-vessels are classified, according to the service for which they are specially designed, as battle-ships, coast-defense and harbor-defense ships, cruisers (which are classed as armored, protected, or unarmored, according to their degree of defensive power), lookout ships, gunboats, despatch-vessels, rams, torpedo-boats, torpedo-boat destroyers, etc. The development of rapid-firing guns in recent years has resulted in increasing the area on the side of the ship covered by armor and the number of guns protected by armor. This involves making the armor of less thickness and compensating for this by improvements in manufacture by which its resisting power is increased. See *armor-plate.* On the other hand, it has resulted in placing armor on high-speed cruisers, sacrificing something of the speed for this purpose, accompanied by a great increase of size. The modern battle-ship is intended to combine in one vessel the most powerful offensive and defensive weapons of floating warfare. To be effective it is necessarily of large size, with a tendency toward continual increase, limited only by the depth of water in the harbors which it must necessarily frequent. The battle-ship may be divided into three portions, namely, the part under water, that in the vicinity of the water-line, and the upper works. In the first are carried the propulsive machinery and boilers, coal, the steering-gear, the submerged torpedo-tubes, the ammunition, and the greater part of the stores. Upon the integrity of this part depends the floating of the ship. It is subject to attack by mines and torpedoes, and the machinery within it is liable to destruction by fragments of exploding shells or by mortar fire. To protect it from mines and torpedoes, the under-water body is divided into a great number of compartments by an outer and inner skin and a number of water-tight transverse and longitudinal frames and bulkheads, so that the space to which water can gain access by a single explosion will be limited and will not seriously impair the floating power. This is, however, the most vulnerable part of a battle-ship. Attempts to armor the bottom against explosions under water have not yet been made to any extent, because the weight required is prohibitive. To prevent the penetration of projectiles from above, there is a protective or armored deck, usually from 2 to 4 inches thick, the middle part of which is a little above the water-line. This deck extends out to the side at the top of the belt-armor, or, in the most recent ships, slopes down at the sides to the bottom edge of the armor-belt from 4 to 6 feet under water. There is sometimes a second protective deck below the first one to catch fragments which pass through the first, and this is sometimes called a *splinter-deck.* The part of the ship immediately above the protective deck is the *raft-body.* See supplement.

To exist; have existence or being; possess reality; be the case; be true or real.

> To *be*, or not to *be*, that is the question.
> *Shak.*, Hamlet, iii. 1.

> Creatures which only *are*, and have a dull kind of being not yet privileged with life.
> *Sir T. Browne*, Religio Medici, i. 34.

> Time *was*, Time *is*, and Time shall *be* no more.
> *Southey.*

2. To take place; occur; happen; come about: as, the wedding will *be* to-morrow; his birthday *was* last week; it was to *be*.—3. Usually, *be* is a mere copula, or sign of predication, a link between a subject and a predicate. As such it asserts, or expresses as fact, the inclusion of the subject among the things denoted by the predicate, or the possession by the subject of the characters signified by the predicate; and this it does with temporal and modal modifications, while the whole substance of the predication, or all that is predicated, is expressed separately, in noun or adjective form, or the equivalent of such: thus, I *am* good, he *was* a hero, they *will be* there, we *should have been* beloved. Hence, every other predicating word or verb may be analyzed into a form of *be*, expressing the predication, and an adjective or noun expressing what is predicated: thus, he *loves* into he *is loving*, or he *is a lover*, and so on. Such a copula is possessed by many languages, being, as in English, reduced to that value by gradual attenuation of an originally substantial meaning; as in modern French, *était*, 'was,' from Latin *stabat*, or nearly as *exist*, literally 'stand forth.'

4. In *metaph.*, to subsist in a state not necessarily amounting to actual existence; have the rudiments of existence. See *being*.—5. An auxiliary verb denoting subsistence in or subjection to the mode of action or being expressed by the principal verb. (*a*) Joined with a present participle, it has the grammatical construction of a predicate adjective qualifying the subject, to make a continuous or progressive or imperfect present: thus, *I am loving*, etc., beside *I love*, etc.—to match which the language has rather recently acquired a corresponding passive, *I am being loved*, beside *I am loved*. (*b*) It is joined with a past participle (having the same construction as above), to make phrases equivalent with the passive verb-forms or verb-phrases of other languages: thus, *he is loved*, Latin *amatur*, German *er wird geliebt*. Hence such phrases are ordinarily viewed as making a passive conjugation of the English verb. They are undistinguished in form from mere combinations of *be* with a predicate participle: thus, *he is beaten* is passive when it means 'somebody is beating him,' but not when it means 'he is a beaten man,' or 'somebody has beaten him.' (*c*) Formerly, as still to a very limited extent (much more in other related languages, as German and French), *be* was the auxiliary used in making the past tenses of intransitive verbs, as *have* of transitives: thus, he *is* come, they *were* gone (German *er ist gekommen*, French *ils étaient allés*), and so on. At present, *have* has come to be the auxiliary almost universally used in this sense.

> The heathen *are perished* out of his land [that is, have perished and now no longer exist in the land]. Ps. x. 16.

(*d*) An infinitive with *to* after *be* forms a sort of future, often with a certain implication of obligation: thus, he *is to* come, they *were to* appear, she *would have been to* blame or *to be* blamed. [*Be*, with *to*, in perfect tenses (*have been*, *had been*, etc.), is used in the sense of *go*, yet hardly except in colloquial style: thus, he *has been to* Paris; we *had been to* see her.]—**Been and**, a common vulgarism introduced pleonastically into the perfect and pluperfect tenses of other verbs: sometimes extended to *been and gone and*.

> Sir Pitt has *been and* proposed for to marry Miss Sharp.

be-[1]. [ME. *be-*, in early ME. commonly *bi-*, < AS. *be-*, *bi-*, = OS. *bi-* = OFries. *be-*, *bi-*, = D. *be-*, MLG. *bi-*, *be-*, LG. *be-* = OHG. *bi-*, *be-*, MHG. G. *be-* = Goth. *bi-* (lengthened under stress, as in comp. with a noun, AS. *bī-*, *big-*, D. *bij-*, OHG. MHG. *bī-*, G. *bei-*), an inseparable prefix, orig. the same as the prep., AS. *be*, *bī*, E. *by*, meaning primarily 'about,' being prob. = L. *-bi*, Gr. *-φι*, in L. *ambi-*, Gr. *ἀμφί*, about (see *ambi-*, *amphi-*): see *by*[1] and *be-*[2].] An inseparable prefix of verbs, and of nouns thence derived. It means primarily 'about,' 'around,' as in *beset*, *begird*, whence the more general sense 'around,' 'all over,' leading to a merely intensive use, as in *besmear*, *bespatter*, *besprinkle*, etc. It is also used to form transitive verbs from nouns, as *begem*, *bedew*, *befog*, *bemire*, etc., or from intransitive verbs, as *belie*, *behowl*, *besing*, etc., verbs of either class often conveying slight contempt, as *bepraise*, *beplaster*, *bepowder*, etc., and are hence often made for the nonce. In a few verbs, all obsolete except *behead*, *be-* assumed a privative force; while in many verbs this prefix, through loss of the simple verb, or a deflection of its sense, or by mere dilution, has now no assignable force, as in *begin*, *bequeath*, *become*, *behold*, etc.

be-[2]. [ME. and AS. *be-*, *bi-*, or separately *be*, *bi*, being the prep. with following adv. or noun: see *be-*[1].] An inseparable prefix of adverbs, which may also be used as prepositions or conjunctions. It is properly the preposition *by*, Middle English *be*, *bi*, (*a*) used adverbially, as in *before*, *behind*, *between*, *betwixt*, *below*, etc., contracted in *above*, *about*; or (*b*) merged with the governed noun, as in *because*, *beside*, that is, 'by cause,' 'by side': so also in *behalf*, originally a prepositional phrase, now taken as a noun. See ★the words cited.

(also *gebed* = OS. *gibed* = OHG. *gabet*, MHG. G. *gebet*, neut.), a prayer, < *biddan*, etc., pray: see *bid.* Beads are used by Roman Catholics to keep them right as to the number of their prayers, one bead of the rosary being dropped every time a prayer is said; hence the transference of the name from that which is counted (the prayers) to that which is used to count with. Cf. Sp. *cuentas*, Pg. *contas*, the beads of a rosary, < Sp. Pg. *contar*, count.] **1**†. Prayer; a prayer; specifically, a prayer of the list or bead-roll, read at public church-services by the preacher before his sermon, or by the curate (see *bead-roll*): usually in the plural. Hence, in this sense, *to bid (one's) beads*, to say (one's) prayers. See phrases below.

When holy and devout religious men
Are at their *beads*, 'tis much to draw them thence;
So sweet is zealous contemplation.
Shak., Rich. III., iii. 7.

2. One of the little balls, of wood, cocoanut-shell, pearl, glass, jewels, or other material, strung in a prescribed order, which form the chaplet or rosary in use in the devotions of Roman Catholics, Buddhists, etc., to keep count of the number of prayers said. See *pair of beads*, below.

The commonest, though not the only, appliance for reckoning these prayers was, and still is, a string of *beads* so put together that every set of ten smaller ones for the "Hail Marys" is parted by a larger *bead*, to tell when the "Our Father" must be recited.
Rock, Church of our Fathers, III. i. 320.

3. Anything resembling a rosary-bead, strung with others for ornament, as in necklaces or beadwork: as, glass, amber, metal, coral, or other *beads.*

7. A glass globule for trying the strength of alcoholic spirits. Beads are numbered according to their specific gravities, and the strength of the spirit is denominated by the number of that one which remains suspended in it, and neither sinks to the bottom nor floats on the surface. Among joiners the bead is variously introduced; as: (*a*) *bead and butt* (fig. 1), framed work in which the panel is flush with the framing and has a bead run on two edges in the direction of the grain only, while the ends are left plain; (*b*) *bead and flush* (fig. 2), framed work in which a bead is run on the edge of the framing; (*c*) *bead and quirk* (fig. 3), the edge of a piece of stuff on which a bead is formed, or stuck, as it is called, flush with the surface; (*d*) *bead and double quirk*, or *return bead* (fig. 4), the angle of a piece of stuff on which a bead is stuck and quirked or relieved on both surfaces; (*e*) *bead, butt, and square work*, a panel which has beads on two of its edges on one side only, while the other side is plain. Perhaps ult. = L. *ferus*, wild, *fera*, a wild beast: see *fierce*.] **1.** A large plantigrade carnivorous or omnivorous mammal, of the family *Ursidæ*, especially of the genus *Ursus*. The teeth of the true bears are 42, and none of the molars are sectorial. The animals are less truly carnivorous than most of the order to which they belong, feeding largely upon roots, fruits, etc., as well as honey and insects. The tail is rudimentary, and the muzzle is prominent, with mobile lips and a slender, sometimes very extensile, tongue. The best-known species is the brown or black bear of Europe and Asia, *Ursus arctos*, found chiefly in northerly regions, of which several varieties are described, differing much in size and color, and to some extent in shape; it is ordinarily about 4 feet long and 2½ feet high; its flesh is eaten, its pelt is used for robes, and its fat is in great demand as an unguent known as bear's grease. The grizzly bear of North America, *U. horribilis*, is as regards specific classification hardly separable from the last, and like it runs into several varieties, as the cinnamon bear, etc. It is ordinarily larger than the European, and is noted for its ferocity and tenacity of life. It inhabits the mountainous portions of western North America. The common black bear of North America is a smaller and distinct species, *U. americanus*, usually black with a tawny snout, but it also runs into a cinnamon variety. See cut under *Ursus*. The spectacled bear, *Ursus* or *Tremarctos ornatus*, is the sole representative of the *Ursidæ* in South America: so called from the light-colored rings around the eyes, which have exactly the appearance of a pair of spectacles, the rest of the face and body being black. The Malayan bear or bruang, *U. malayanus*, is a small, black, close-haired species, with a white mark on the throat, with protrusile lips and slender tongue, capable of being taught a variety of amusing tricks in confinement. The sloth-bear or aswail of India is distinct from the other bears, and is usually placed in a different genus, *Melursus labiatus*. See *Ursidæ*, and cut under *aswail*.

=**Syn.** *Beautiful*, *Beauteous*, *Handsome*, *Pretty*, *Fair*, *Lovely*, *Comely*, charming, all apply to that which is highly pleasing, especially to the eye. *Beautiful*, the most general of these words, is also often the noblest and most spiritual, expressing that which gives the highest satisfaction to eye, ear, mind, or soul. *Beauteous* is chiefly poetic, and covers the less spiritual part of *beautiful*. *Handsome* is founded upon the notion of proportion, symmetry, as the result of cultivation or work; a *handsome* figure is strictly one that has been developed by attention to physical laws into the right proportions. It is less spiritual than *beautiful;* a *handsome* face is not necessarily a *beautiful* face. *Handsome* applies to larger or more important things than *pretty:* as, a *handsome* house; a *pretty* cottage. It is opposed to *homely*. *Pretty* applies to that which has symmetry and delicacy, a diminutive beauty, without the higher qualities of gracefulness, dignity, feeling, purpose, etc. A thing not small of its kind may be called *pretty* if it is of little dignity or consequence: as, a *pretty* dress or shade of color; but *pretty* is not used of men or their belongings, except in contempt. *Fair* starts from the notion of a brightness that catches the eye; it notes that sort of beauty which delights the eye by complexion and feature; in this sense it is now less common in prose. *Lovely* is a strong word for that which is immediately pleasing to the eye; it applies primarily to that which excites admiration and love. *Comely* applies rather to the human figure, chiefly in its proportions; it is used less commonly than *handsome* to express the result of care or training. See *elegant*.

And *beautiful* as some fair saint.

It has short ears, a blunt nose, small fore feet, large webbed hind feet, with a flat ovate tail covered with scales on its upper surface. It is valued for its fur (which used to be largely employed in the manufacture of hats, but for which silk is now for the most part substituted) and for an odoriferous secretion named castor or castoreum (which see).

Its food consists of the bark of trees, leaves, roots, and berries. The favorite haunts of the beavers are rivers and lakes which are bordered by forests. When they find a stream not sufficiently deep for their purpose, they throw across it a dam constructed with great ingenuity of wood, stones, and mud, gnawing down small trees for the purpose, and compacting the mud by blows of their powerful tails. In winter they live in houses, which are from 3 to 4 feet high, are built on the water's edge with subaqueous entrances, and afford them protection from wolves and other wild animals. They formerly abounded throughout northern America, but are now found only in unsettled or thinly populated regions. Several slightly different varieties of the European beaver have received special names. The North American beaver is somewhat larger than the European, and exhibits some slight cranial peculiarities;

(Bœotian) *Φίκιον* ('Peak'), the name of a mountain, *φῑ́ξ*, the sphinx, etc.] 1. An insect of the genus *Apis*; a hive-bee or honey-bee. See *Apis*[1]. The common honey-bee, *A. mellifica*, has from the earliest periods been kept in hives for its wax and honey. It is also found wild in great numbers (now especially in North America, where the bee was introduced by the European colonists), storing honey in hollow trees or in other suitable situations. It lives in swarms or societies of from 10,000 to 50,000 individuals. These swarms contain three classes of bees—the perfect females or queen bees, the males or drones, and the imperfect or undeveloped females, called *neuters*, constituting the working bees. In each hive or swarm there is only one female or queen, whose sole office is to propagate the species. The queen is much larger than the other bees. When she dies, a young working bee three days old is selected, its cell is enlarged by breaking down the partitions, its food is changed to royal jelly or paste, and it grows into a queen. The queen lays 2,000 eggs a day. The drones serve merely for impregnating the queen, after which they are destroyed by the neuters. These last are the laborers of the hive. They collect the honey, form the cells, and feed the other bees and the young. They are furnished with a proboscis by which they suck the honey from flowers, and a mouth by which they swallow it, conveying it then to the hive in their stomachs, whence they disgorge it into the cells. The pollen of flowers settles on the hairs with which their body is covered, whence it is collected into pellets by a brush on their second pair of legs, and deposited in a hollow in the third pair. It is called *bee-bread*, and is the food of the larvæ or young. The adult bees feed on honey. The wax was at one time supposed to be formed from pollen by a digestive process, but it is now ascertained that it is formed by secretion from the honey. The females and neuters have a barbed sting attached to a bag of poison, which flows into the wound inflicted by the sting. When a hive becomes overstocked a new colony is sent out under the direction of a queen bee. This is called *swarming*. Besides the common bee, *A. mellifica*, there are the *A. fascicata*, domesticated in Egypt; the *A. ligustica*, or Ligurian bee of Italy and Greece, introduced generally into apiaries in other lands; the *A. unicolor* of Madagascar; the *A. indica*, etc.

Gael. *beoir*, from AS. or E. (the Scand. word is that cognate with E. *ale*). Origin uncertain; some assume a loss of *r* from orig. **breór*, < AS. *breówan*, etc., brew: see *brew*.] 1. An alcoholic liquor made from any farinaceous grain, but generally from barley, which is first malted and ground, and its fermentable substance extracted by hot water. To this extract or infusion hops or some other vegetable product of an agreeable bitterness is added, and it is thereupon boiled for some time, both to concentrate it and to extract the useful matters from the hops. The cooled liquor, with yeast added, is suffered to ferment in vats, the time of fermentation depending upon the quality and kind of beer, and after it has become clear it is stored away or sent to the market. The beers of England and France, and for the most part those of Germany, become gradually sour by exposure to air. *Ale* and *beer* were formerly synonymous terms, *ale* being the earlier in use; at present, *beer* is the common name for all malt liquors, and *ale* is used specifically for a carefully made beer of a certain strength, and rather light than dark: thus, small beer, ginger beer, and the like, are not ale, nor are stout and porter. A statement made by Andrew Boorde, in 1542, that ale is made of malt and water, and should contain no other ingredients, while beer is made of malt, hops, and water, is not now true.

beg[1] (beg), *v.*; pret. and pp. *begged*, ppr. *begging*. [Early mod. E. also *begg*, *begge*, < ME. *beggen*, first found in the early part of the 13th century (in the "Ancren Riwle"); origin un-

certain. Various explanations have been offered: (1) < ME. *bagge*, a bag (because beggars carry bags: see first quotation under *beggar, n.*); but this is certainly wrong. It would imply the forms **beggen*, **begge*, as variants of *baggen*, *bagge*, but no such variants are found or are probable, and no such sense as 'put into a bag,' or 'carry a bag,' which might connect the notion of 'bag' with that of 'beg,' belongs to the ME. verb *baggen*, which is found only in the sense of 'swell out like a bag'; the sense of 'put into a bag' is modern, and that of 'carry a bag' does not exist; *bagger*, moreover, the supposed antecedent of *beggar*, is only modern. (2) < AS. *bedecian*, beg (connected with Goth. *bidagwa*, a beggar, appar. < *bidjan* = AS. *biddan*, E. *bid*, ask; cf. D. *bedelen* = OHG. *betalōn*, MHG. *betelen*, G. *betteln*, beg, freq. of D. *bidden* = G. *bitten* = AS. *biddan*, E. *bid*, ask); but the AS. *bedecian* occurs but once, in the 9th century, and there are no intermediate forms to connect it with ME. *beggen*. (3) < OFlem. **beggen*, beg; but there is no such word. (4) < OF. *beg-*, the common radical of *begard*, *begart*, *beguard*, *begar* (ML. *begardus*, *beggardus*, *beghardus*, etc.), and *beguin* (ML. *beginus*, *begginus*, *beghinus*, *beguinus*, etc.), names given to the members of a mendicant lay brotherhood (see *Beghard* and *Beguin*); also applied to any begging friar or other beggar. Such mendicants were very numerous at the time of the first appearance of the E. verb, and the derived OF. verb *beguiner*, *beguigner* (< *beguin*), with AF. *begger*, is actually found in the sense of 'beg.' The E. verb may be a back formation from the noun *beggar* (ME. *begger*, *beggere*, *beggar*, *beggare*), which is, in this view, an adapted form (as if a noun of agent in *-ar*[1], *-er*[1]) of the OF. *begar*, *begard*, etc., a Beghard. *Beghard* is otherwise not found in ME., though the precise form *begger* is found in Wyclif and later as a designation of the mendicant friars (Beghards), appar. without direct reference to their begging.] **I.** *trans.* **1.** To ask for or supplicate in charity; ask as alms.

Pg. *beguino* = It. *beghino, bighino*, < ML. *beghinus, beginus, begginus, beguinus, biginus*, etc.: formed, first as fem., with suffix *-in*, ML. *-ina, -inus*, from the name of Lambert *Begue* or *le Begue* (i. e., the stammerer: OF. *begue*, mod. F. *bègue*, dial. *beique, bieque*, stammering; of unknown origin), a priest of Liège, who founded the sisterhood. See also *Beghard*. The origin of the name was not generally known, and the forms varied, leading to many etymological conjectures. The connection with E. *beggar* and *beg*[1] is perhaps real; in the sense of 'hypocrite' and 'bigot' (as in It. *beghino*), the word was later confused with *bigot*, q. v.] **1.** A name given to the members of various religious communities of women who, professing a life of poverty and self-denial, went about in coarse gray clothing (of undyed wool), reading the Scriptures and exhorting the people. 2. [Only *Beguin*.] A member of a community of men founded on the same general principle of life as that of the Beguines (see 1). They became infected with various heresies, especially with systems of illuminism, which were afterward propagated among the communities of women. They were condemned by Pope John XXII. in the early part of the fourteenth century. The faithful Beguins joined themselves in numbers with the different orders of friars. The sect, generally obnoxious and the object of severe measures, had greatly diminished by the following century, but continued to exist till about the middle of the sixteenth. Also called *Beghard*. [These names have been frequently used as common nouns, without capitals.]

beguinage (beg′in-āj, or, as mod. F., bā-gē-nāzh′), *n.* [F. *béguinage*, OF. *beguinage* (> ML. *beghinagium*), < *beguine*, a Beguine. See *Beguin* and *-age*.] A community of Beguines. A beguinage usually consists of a large walled inclosure, containing a number of small detached houses, each inhabited by one or two Beguines; there are also some common houses, especially for the novices and younger members of the community. In the center is the church, where certain religious offices are performed in common. Each Beguine keeps possession of her own property, and may support herself from it, or from the work of her hands, or by serving others in their houses. They are free to leave at any time, and take only simple vows of chastity and obedience during residence. Pious women may also, under certain restrictions, rent houses and live inside the inclosure without formally joining the community. Such establishments are now chiefly met with in Belgium; the immense one near Ghent, built by the Duke of Aremberg in 1874, is the finest example, and one of the most recent.

We may speak of lofty or gracious *carriage;* good, bad, wise, foolish, modest, conceited *behavior;* exemplary *conduct;* grand, modest, correct *deportment;* quiet, refined *demeanor*.

★ **being** (bē'ing), *n.* [< ME. *beynge*, *byinge*, verbal n. of *been*, be.] 1. Existence in its most comprehensive sense, as opposed to non-existence; existence, whether real or only in thought.—2. In *metaph.*, subsistence in a state not necessarily amounting to actual existence; rudimentary existence. But the word is used in different senses by different philosophers. Hegel defines it as immediacy, that is, the abstract character of the present. In its most proper acceptation, it is the name given by philosophical reflection to that which is revealed in immediate consciousness independently of the distinction of subject and object. It may also be defined, but with less precision, as the abstract noun corresponding to the concrete class embracing every object. *Being* is also used in philosophy influenced by Aristotle to signify the rudiment or germ of existence, consisting in a nature, or principle of growth, before actual existence. It is also frequently used to mean actual existence, the complete preparation to produce effects on the senses and on other objects. Psychologically, *being* may be defined as the objectification of consciousness, though the distinction of subject from object logically presupposes being.

Wee may well reject a Liturgie which had no *being* that wee can know of, but from the corruptest times.
Milton, Def. of Humb. Remonst.

2. A conviction of the truth of a given proposition or an alleged fact, resting upon grounds insufficient to constitute positive knowledge. Knowledge is a state of mind which necessarily implies a corresponding state of things; belief is a state of mind merely, and does not necessarily involve a corresponding state of things. But *belief* is sometimes used to include the absolute conviction or certainty which accompanies knowledge.

Neither do I labor for a greater esteem than may in some little measure draw a *belief* from you, to do yourself good, and not to grace me. *Shak.*, As you Like it, v. 2.

Belief admits of all degrees, from the slightest suspicion to the fullest assurance. *Reid.*

He [James Mill] uses the word *belief* as the most general term for every species of conviction or assurance; the assurance of what is before our eyes, as well as of that which we only remember or expect; of what we know by direct perception, as well as of what we accept on the evidence of testimony or of reasoning. *J. S. Mill.*

By a singular freak of language we use the word *belief* to designate both the least persistent and the most persistent coherence among our states of consciousness,—to describe our state of mind with reference both to those propositions of the truth of which we are least certain, and to those of the truth of which we are most certain.
J. Fiske, Cosmic Philos., I. 61.

3. Persuasion of the truth of a proposition, but with the consciousness that the positive evidence for it is insufficient or wanting; especially, assurance of the truth of what rests chiefly or solely upon authority. (*a*) In this sense, the word sometimes implies that the proposition is admitted as only probable. (*b*) It sometimes implies that the proposition is admitted as being so reasonable that it needs no proof. (*c*) Sometimes used for religious faith.

Knowledge and *belief* differ not only in degree but in kind. Knowledge is a certainty founded upon insight; *belief* is a certainty founded upon feeling. The one is perspicuous and objective: the other is obscure and subjective. *Sir W. Hamilton*, Lectures on Logic, xxvii.

One in whom persuasion and *belief*
Had ripened into faith, and faith become
A passionate intuition. *Wordsworth*, Excursion, iv.

They [women] persuade rather than convince, and value *belief* rather as a source of consolation than as a faithful expression of the reality of things.

★**bell**[1] (bel), *n.* [Early mod. E. also *bel*, < ME. *bel, belle*, < AS. *belle* (= D. *bel* = MLG. LG. *belle*; cf. Icel. *bjalla*, < AS. *belle*), a bell. Perhaps connected with *bell*[2], *v.*, roar.] **1.** A hollow metallic instrument which gives forth a ringing sound, generally of a musical quality, when struck with a clapper, hammer, or other appliance. Its usual shape resembles that of an inverted cup with a flaring rim. If the bell is stationary, it is often made saucer-shaped, and in this case is commonly termed a *gong*. Bells of this form are generally used as call-bells or signal-bells. Bells are made for many purposes and in a great variety of forms and sizes. They usually consist of an alloy of copper and tin, called bell-metal (which see). Church-bells are known to have been in use in Italy about A. D. 400, and in France in the sixth century. The earlier bells were often four-sided, made of thin plates of iron riveted together. The manufacture of the largest and finest bells has been developed since the fifteenth century. The largest ever made is the great bell of Moscow, called the Czar Kolokol, cast in 1733, and computed to weigh about 440,000 pounds. It is about 19 feet in diameter and the same in height. It is supposed never to have been hung, and is now used as a chapel, having been raised in 1836 after lying half buried since 1737, when a piece was broken out of its side in a fire. The largest bell in actual use weighs 128 tons, and is also in Moscow. The bell of the Buddhist monastery Chi-on, in Kioto, Japan, was cast in 1633, and weighs 125,000 catties, or over 74 tons of 2,240 pounds each. Among the great

Bell called Czar Kolokol, in the Kremlin, Moscow.

French bells, the *bourdon* of Notre Dame, Paris, weighs about 17 tons; the largest bell of Sens cathedral, 16 tons; and that of Amiens cathedral, 11 tons. In England, the "Big Ben" of Westminster weighs over 13 tons, but is cracked; the "Great Peter," at York, 10 tons; and the "Great Tom," at Oxford, 7 tons. The new "Kaiserglocke" of Cologne cathedral weighs 25 tons. For church-bells made to be rung in unison, see *chime*. In heraldry, the bells generally represented are hawks' bells, in shape like a small sleigh-bell; a hawk represented with these bells attached is said to be *belled*. When a bell of ordinary form is used as a bearing, it is called *church-bell* for distinction.

But what art thou that seyst this tale,
That werest on thyn hose a pale,
And on thy tipet such a *belle?*
Chaucer, House of Fame, l. 1841.

2. Anything in the form of a bell or compared to a bell. Specifically—(*a*) A bell-shaped corolla of a flower.

(*b*) In *arch.*, the plain echinus of a Corinthian or composite capital, around which the foliage and volutes are arranged. Also called *basket*. (*c*) The large end of a funnel, or the end of a pipe, tube, or any musical instrument, when its edge is turned out and enlarged so as to resemble a bell. (*d*) The strobile, cone, or catkin containing the seed of the hop. (*e*) The pendulous dermal appendage under the throat of the male moose. (*f*) In hydroid polyps, the umbrella or gelatinous disk.

3. *pl.* A number of small bells in the form of hawks' bells or sleigh-bells, fastened to a handle and constituting a toy for amusing an infant.—**4.** *pl. Naut.*, the term employed on shipboard, as *o'clock* is on shore, to denote the divisions of daily time, from their being marked by bells, which are struck every half-hour. The day, beginning at midnight, is divided into watches of four hours each, except the watch from 4 to 8 P. M., which is subdivided into two dog-watches. A full watch thus consists of eight half-hours, and its progress is noted by the number of strokes on the bell. For instance, 1 o'clock P. M. is equivalent to two bells in the afternoon watch; 3 o'clock, to six bells; 4 o'clock, to eight bells, etc. —**Angelus bell, Gabriel bell**†, **Lady bell,** a church-bell rung to remind those within hearing to recite the angelus. See *angelus*.—**Ave bell, Ave Maria bell,** or **Ave Mary bell.** Same as *angelus bell*.

Sir T. Browne, Religio Medici, i. 3.

Bell, book, and candle, a phrase popularly used in connection with a mode of solemn excommunication formerly practised in the Roman Catholic Church. After the formula had been read and the book closed, the assistants cast the lighted candles they held in their hands to the ground so as to extinguish them, and the bells were rung together without order; the last two ceremonies symbolized the disorder and going out of grace in the souls of the persons excommunicated.—**Blessed or hallowed bell,** in the *Rom. Cath. Ch.*, a bell which has received the solemn blessing of the church, in which the bishop prays that its sound may avail to summon the faithful, to excite their devotion, to drive away storms, and that the powers of the air, hearing it, may tremble and flee before the standard of the holy cross of the Son of God engraved upon it, etc.—**Elevation** or **Sanctus bell,** in the *Rom. Cath. Ch.*, a bell rung during the celebration of mass to give notification of the more solemn portions: now usually a small hand-bell, but in pre-Reformation English churches a large bell often hung in a bell-gable erected over the nave, immediately above the entrance of the chancel, from which it was rung by one of the acolytes. *Oxford Glossary*, p. 74.—**In the bell.** (*a*) In flower. [Scotch.] (*b*) In seed, or having the seed-capsules formed, as hops.—**Mass bell.** Same as *sacring bell*.—**Recording bell,** a bell attached to a hand-punch, or to an instrument of similar purpose, with which fares collected, as by a conductor, etc., or moneys taken in, as at a bar, are recorded.—**Sacring bell,** a bell rung during the celebration of the Roman Catholic mass, at the elevation of the host, at the Sanctus, and at other solemn services. When rung at the consecration it is also called the *Agnus bell*; at the time of the Sanctus, the *Sanctus bell*, etc. Also called *saints' bell*.—**Saints' bell.** Same as *sacring bell*. The term is a corrupted form of *Sanctus bell*, but is no longer specifically restricted to the bell rung at the Sanctus. The saints' bell is now a small hand-bell rung within the church, but formerly it was sometimes a small church-bell suspended in a turret outside the church and rung by a rope from within.

The proudest he that holds up Lancaster,
Dares stir a wing, if Warwick *shake* his *bells*.

It consists essentially of an air-chamber which can be alternately expanded and contracted, and a nozle by which the current of air can be directed. The edges of those folds which are turned outward are usually stiffened by a wire frame. When the tube is pulled out to its full extent, its walls are flat; when it is contracted, it requires merely the space taken up by the folds of its material. In use, the back of a camera of this form can be fixed, by a screw or other device, at any distance from the front or lens end, within the limits of the contracted or expanded tube, that the focus of the lens or the particular work in hand may require.

2. In the *Gr. Church*, the sanctuary or chancel; the inclosed space surrounding the altar. The *benediction* . . . is given in a different manner by the Oriental Church from that used by the Latins. The Priest joins his thumb and third finger, and erects and joins the other three: and is thus supposed to symbolise the procession of the Holy Ghost from the Father alone; and, according to others, to form the sacred letters I H C by the position of his fingers.
J. M. Neale, Eastern Church, i. 352, note.

When the benediction is pronounced officially by a priest or clergyman, he usually stands with hands uplifted, and the congregation receive it with bowed heads. Illustrations of ancient benedictions are afforded by Gen. xxiv. 60 (a nuptial blessing); Gen. xxvii. 27–29 (a death-bed blessing); Num. vi. 24–27 (a priestly blessing). The *apostolic benediction* is that proceeding from the pope, and is either given personally, as at Rome, or by delegation in other parts of the world. See *blessing.* (*b*) The rite of instituting an abbot or an abbess, and of receiving the profession of a nun or of a religious knight.

2. An ecclesiastical living; a church office endowed with a revenue for its proper fulfilment; the revenue itself. The following terms of canon law are frequently found associated with this word, which is of historical importance: A benefice involving no other obligation than service in the public offices of the church is *simple;* if the cure of souls is attached to it, *double;* if with a certain rank attached, *dignitary* or *major;* the two former without rank, *minor*. Thus, a *chantry* was a simple benefice; a *prebend* gives the right to only a part of the income of a canonry attached to a collegiate or cathedral church; while the *benefice* is perpetual and has a charge, though there are some (called *manual*, from their being in the hands of the one conferring them) revocable. The benefice is said to be *regular* if held by one qualified to fulfil the duties of the office; *secular* if held by a layman; and *in commendam* when in the charge of one commended by the proper authorities until one duly qualified to fulfil its duties is appointed. In the last-named case the discharge of the office is provided for at the expense of the holder. (See *abbé*.) A benefice is received by *election*, for example, by a chapter, or from a *patron*, who is properly said to *present* to it, or is *conferred* by the proper ecclesiastical superior; these nominations, in the Roman Catholic Church, regularly need *confirmation* from the pope. His action may cause a benefice to be *reserved* or *affected* (which see); or the collation is made *alternative*, that is, to the pope and regular patron or superior, according to the months in which the benefice falls vacant, by definite system.

2. A benefaction; a beneficent act or gift. =**Syn.** *Benevolence, Beneficence, Bounty, Liberality, Generosity, Munificence, Charity.* *Benevolence*, literally well-wishing, is expressive of the disposition to do good; hence it easily came to be applied to charitable gifts. *Beneficence*, literally well-doing, is the outcome and visible expression of benevolence. It is a strong though general word for active and abundant helpfulness to those who are in need. *Benevolence* may exist without the means or opportunity for beneficence, but *beneficence* always presupposes *benevolence*. *Bounty* is expressive of kind feeling, but more expressive of abundant giving. *Liberality* is giving which is large in proportion to the means of the giver. *Generosity* adds to the notion of liberality that of largeness or nobleness of spirit in connection with the gift. *Munificence* is giving on a large scale, not restricting itself to necessary things, but giving lavishly; it is the one of these words most likely to be applied to ostentatious or self-seeking liberality, but not necessarily so. *Charity*, while having the best original meaning, has come to be a general word; as to gifts, it is what is bestowed upon the poor or needy, but not always with warm or kindly feelings: as, official *charity*.

The *Berkeleian* idealism is little more than the easy demonstration that this view [that the world of reality exists quite independently of being known by any knowing beings in it], from a philosophical standing point, is untenable. *J. C. Shairp*, Culture and Religion, p. 185.

The Berkeleian idealism is intimately interwoven with an extreme nominalism, which denies the existence of general conceptions. Berkeley's theory of vision, which in a modified form is now generally adopted by scientific men, is that while we see two dimensions of space, the third is recognized by touch (that is, by the muscular sense), until the eyes become educated to associating certain appearances with certain feelings of touch.

The Book, or rather the Books (see etym.), by way of eminence; the Scriptures of the Old and New Testaments. The word *bible* is not found in the English version, but the Greek word occurs frequently, being always translated "book" or "books," sometimes indicating the books of the Old Testament. The Bible consists of two parts: the Old Testament, written in Hebrew, containing the Law, the Prophets, and the sacred writings, or Hagiographa; and the New Testament, written in Greek, consisting of the four Gospels, the Book of Acts, the Epistles of Paul and other apostolic writers, and the Apocalypse or Book of Revelation, the only strictly prophetic book which it contains. Roman Catholic writers accept, in addition to these, most of the books contained in the Apocrypha of the King James version, which occur in the Septuagint (see below) and Vulgate, distributed among the other books of the Old Testament. The principal ancient versions of the Bible, or of portions of it, are the *Targums*, a Chaldee or Aramaic paraphrase or interpretation of the more ancient Hebrew Scriptures; the *Samaritan Pentateuch*, a Hebrew version of the first five books of the Old Testament, ancient in its character, and preserved with jealous care among the Samaritans; the *Septuagint*, a Greek version of the Old Testament prepared by Jewish scholars at Alexandria under the Ptolemies, principally in the third century B. C.; the *Vulgate*, a Latin version of both Old Testament and New Testament, prepared by Jerome at the close of the fourth century A. D.; and the *Peshito*, a Syriac version of the Old Testament and the major part of the New Testament, probably prepared in the second century A. D. Translations were early made into the principal languages of Christendom. The first complete translation into English was that of Wyclif and Nicholas Hereford, about 1382; and the first printed English versions were those of Tyndale and Coverdale, 1524–1535. Other important versions are the *Lutheran*, in the German, by Martin Luther, 1521–34—the basis of the Swedish, Danish, Icelandic, Dutch, and Finnish versions; the *Authorized* or *King James*, prepared by a special commission of scholars in England under James I., 1604–11; the *Douay*, a popular name given to a translation into English prepared by Roman Catholic divines—the Old Testament at Douay (1609–10), the New Testament at Reims (1582); and the *Revised*, a recension of the King James Bible prepared by a committee of British and American Protestant divines, the New Testament appearing in 1881, and the Old Testament in 1885. The number of minor versions is indicated by the fact that, since 1804, translations of the Bible or portions of it have been published in upward of 225 languages. Roman Catholics and Protestants differ in the degree of authority which they attach to the Bible. The Roman Catholic Church "receives with piety and reverence all the books of the Old and New Testaments, since one God is the Author of each" (Council of Trent); but "at the same time it maintains that there is an unwritten word of God over and above Scripture" (Cath. Dict.). Protestants generally hold that "the Supreme Judge, by which all controversies of religion are to be determined, and all decrees of councils, opinions of ancient writers, and private spirits are to be examined, and in whose sentence we are to rest, can be no other but the Holy Spirit speaking in Scripture" (Westminster Conf. of Faith).

It was the first complete Bible to appear in Roman type, the first to omit the Apocrypha, and the first to recognize the division into verses. This translation was in common use in England till the version made by order of King James was introduced in 1611. The Geneva Bible has also been called the *Breeches Bible*, because Gen. iii. 7 is translated, "Then the eyes of them both were opened, and they knew that they were naked, and they sewed fig leaves together and made themselves *breeches*." "Breeches" occurs in previous translations, though the name is given especially to this one.—**Mazarin Bible**, an edition of the Bible printed by Gutenberg at Mentz in 1450–55, being the first book ever printed with movable types. It was so called because the first known copy of it was discovered in the Mazarin library at Paris in 1760.—**Vinegar Bible**, an edition printed at the Clarendon press, Oxford, in 1717, with the heading to Luke xx. as the "Parable of the *Vinegar*," instead of the "Parable of the *Vineyard*."—**Wicked Bible**, an edition printed in 1631 in which the word *not* is omitted from the seventh commandment.

an essential analytical similarity to a pair of circles, which it also somewhat resembles to the eye. For the purpose of tracing it, it may be defined as the envelop of all the circles having their centers on a fixed ellipse or hyperbola, and cutting a fixed circle orthogonally. This circle is called the *focal circle*, because its intersections with the fixed conic are foci of the quartic. The latter has, besides, two double foci, which are the foci of the conic. The perpendiculars from the center of the focal circle to the asymptotes of the conic are bitangents of the quartic. (See fig. 1.) The intersections of the focal circle with the quartic are *cyclic points* of the latter. There are three genera of bicircular quartics. The first embraces all the bicursal forms, and these are curves of the eighth class. For these there are two real focal circles and two imaginary ones. The two real conics of centers are an ellipse and a confocal hyperbola. There are four real foci and four real cyclic points. This genus has two divisions. In the first, the four real foci are *concyclic*, and the real curve consists of two ovals, one of which lies without or within the other, according as the four real foci are on a central ellipse or hyperbola. Fig. 1 shows the latter case, and fig. 2, modified so as to make the upper part like the lower, would show the former. Bicircular quartics of this division have the property that three points can be taken so that the distances r_1, r_2, r_3, of any point of the curve therefrom shall be expressable by an equation $ar_1 + br_2 + cr_3 = 0$.

Fig. 2.
First genus, second division; one real oval.

Fig. 3.
Second genus, nodal curve.

The second division of the first genus embraces curves whose four real foci lie in two pairs or two focal circles. These real curves consist of single ovals, as in fig. 2. The second genus comprises unicursal curves with one node (besides those at the circular points). They are of the sixth class. There is one real and one imaginary focal circle. The node may be a crunode with an outloop (shown by slightly modifying fig. 2 in the upper part) or with an inloop, as in fig. 3; or it may be an acnode without or within the oval. The third genus contains curves with an ordinary cusp. These are of the fourth class. There is but one focal circle and but one focus. The cusp may point outward, as in fig. 4, or inward, as in a modification of fig. 3.

Fig. 4.
Third genus, cuspidal curve.

This was modified in the earliest form of the bicycle by greatly increasing the relative size of the driving-wheel and bringing the rider directly over it. Later the "safety" bicycle was introduced, in which the wheels were made of equal or nearly equal size, and for the direct action upon the front wheel was substituted indirect action upon the rear wheel, by means of a chain and sprocket-wheels, the diameters of the sprocket-wheels being so proportioned as to compensate the decrease in size of the driving-wheel. Bicycles having seats and driving-gear for several riders placed one behind the other are called *tandems*—a name often restricted to such a bicycle for two riders. A bicycle for three riders is called a *triplet*, one for four a *quadruplet*, etc.—**Chainless bicycle**, a bicycle in which the power is transmitted to the rear wheel by beveled gears or other devices, instead of by a chain and sprocket-wheels.—**Duplex bicycle**, a bicycle designed for two riders sitting side by side.—**Motor bicycle**, one containing a motor (as well as pedals).

bidding-prayer (bid'ing-prār), *n.* [See below.] In England, the prayer before the sermon. As directed in the 55th canon of the Church of England, this is a form in which the preacher calls on the congregation to pray for the church catholic, the sovereign, and different estates of men. A similar form of prayer preceding the sermon has been in use since long before the Reformation. At first it was called *bidding of the beads* (literally, praying of the prayers), after the Reformation *bidding of the common prayers*, *bidding* (*of*) *prayers* or *prayer* (the last word being object of the first); but after the sixteenth century the word *bidding* came to be popularly regarded as an adjective, or the phrase *bidding prayer* as a quasi-compound, a prayer which bids or directs what is to be prayed for. A collect is now generally substituted for the bidding-prayer (and sometimes called by the same name), but on special occasions, and in cathedrals and at university sermons, the bidding-prayer is always used. Liturgiologists often designate the deacon's litanies of the primitive and the Greek Church as *bidding-prayers*. See *ectene* and *litany*.

The needle, bar, disk, or other body which the couple to be measured is to turn is suspended at equal distances from and on opposite sides of its center of gravity by two equally long threads from two fixed points on one higher level. Thus, under the influence of gravity alone, the suspended body comes to equilibrium with the two threads in a vertical plane. When it is turned through any angle about a vertical axis through its center, its weight tends to restore it to its original position; and the moment of this force of restitution can be accurately calculated from the lengths of the threads, the distances of their attachments, and the weight of the suspended body. This moment increases with the angle of displacement up to 90°; consequently, if the force to be measured is not too great, it will, when it is applied, bring the suspended body to equilibrium in a new position, the inclination of which from the old position being observed affords the means of calculating the magnitude of the force.

(*b*) Paper issued by the authority and on the faith of a State to be circulated as money. The Constitution of the United States (Art. Bill of debt, an old term including promissory notes and bonds for the payment of money.—**Bill of entry,** a written account of goods entered at the custom-house, whether imported or intended for export.—**Bill of exceptions.** See *exception*.—**Bill of exchange,** an order in writing, addressed by one person to another, to pay on demand or at a fixed or determinable future time a certain sum in money to a specified person or to his order. Every completed bill of exchange should bear on its face the following: (*a*) three names, namely, those of the drawer, the drawee, and the payee; (*b*) the sum to be paid; (*c*) two dates, namely, the date of drawing and a time for payment or the means of determining the time, as where the bill is payable at sight or a certain time after sight, that is, presentment; (*d*) the place where it is drawn. If the drawer and drawee are the same person, even in legal effect of name, as where a corporation by one officer draws on itself by naming another officer, as such, as the payee, the paper is not a bill of exchange, but a mere draft or promissory note. The drawer and the payee, however, may be the same, as where one draws to his own order and indorses to a third person. If the paper is not payable absolutely, as where it is expressed to be payable only out of a particular fund, it is not a bill of exchange; but a payment absolutely ordered may be directed to be charged to a particular account of the drawer. The words "value received" are usually inserted, but are not essential to validity. The drawee of a bill becomes liable by accepting it, usually done by writing his name across its face, and he is thereafter called the *accepter;* but a bill is negotiable before acceptance. In a foreign bill of exchange, the drawer and drawee are residents of different countries. In this respect, in the United States, the residents of the different States are foreign to one another.—**Bills of exchange acts,** a short name by which are known several British statutes (1871, 1878, and 1882), the last of which codifies the whole body of British law relating to negotiable paper.—**Bill of fare,** in a hotel or restaurant, a list of dishes to be served in due course at a regular meal, or which may be ordered.—**Bill of health,** a certificate signed by a consul or other authority as to the health of a ship's company at the time of her clearing any port or place. A *clean* bill imports that the ship sailed at a time when no infectious disorder was supposed to exist; a *suspected* or *touched* bill imports that there were rumors of such a disorder, but that it had not appeared; a *foul* bill, or the absence of a clean bill, imports that the place of departure was infected when the vessel left.—**Bill of indictment.** See *indictment*.—**Bill of lading,** a receipt for goods delivered to a carrier for transportation. It is usually of goods shipped on board of a vessel and signed by the master of the vessel, acknowledging the receipt of the goods, and usually promising to deliver them in good condition at the place directed, dangers of the sea, the act of God, perils of war, etc., excepted. In foreign trade they are usually drawn up in triplicates, one of which goes to the shipper, one to the consignee, and one is retained by the master. Often abbreviated *B. L.*—**Bills of Lading Act,** a British statute of 1855, vesting rights under bills of lading in the consignee or indorsee, but reserving right of stoppage in transitu and claims for freight. Similar statutes in other jurisdictions are variously known.—**Bill of mortality.** See *mortality*.—**Bill of parcels,** an account given by the seller to the buyer, containing particulars of the goods bought and of their prices; an invoice.—**Bill of particulars,** a writing setting forth in detail the particulars of a matter stated in a more general form in a pleading.—**Bill of Rights.** (*a*) An English statute of 1689 (1 Wm. and Mary, Sess. 2, c. 2) declaring the rights and liberties of the subject, and settling the succession of the crown in William of Orange and Mary, and to the rightful heirs of the latter, but excluding any being Roman Catholics; it also provided that Protestants might have in their possession arms for defense suitable to their conditions. Formerly in the United States the game was played with four balls on a table having six pockets, the players scoring both for caroms and for driving the balls into the pockets. (See *carom.*) This is nearly the present *English game.* Since, however, expert players could continue an inning at the game thus played almost without limit, the pockets were dispensed with and counting was made to depend entirely upon caroms. Later, professional players adopted what is known as the *French game*, in which only three balls are used, and this was modified to the *champions' game*, in which a line, called a *balk-line*, is drawn crossing each corner of the table diagonally, within which two counts only can be made. Experts now play also *cushion-caroms*, in which the cue-ball must touch the cushion before hitting the second object-ball, or hit the second ball again on a return from the cushion; the *balk-line game*, which is the same as the champions' game, but with balk-lines 14 inches from the cushion all round the table; and the *bank-game*, in which the cue-ball must hit the cushion before touching any other ball. [The word *billion* was introduced into French in the sixteenth century, in the sense of a million to the second power, as a trillion was a million to the third power. At that time numbers were usually pointed off in periods of six figures. In the seventeenth century the custom prevailed of pointing off numbers in periods of three, and this led to the change in the meaning of the word *billion* in French. The words *billion*, *trillion*, etc., did not apparently come into use in English until a later date, for Locke ("Essay on the Human Understanding," ii. 16, § 6, 1690) speaks of the use of *billion* as a novelty. The English meaning of the word is thus the original and most systematic. The word *billion* is not used in the French of every-day life, one thousand millions being called a *milliard.*]

The custom is now to revert in this particular to the classification of Linnæus, who included man with the apes, monkeys, and lemurs in one order, *Primates*. The zoölogical rank now usually assigned to the genus *Homo* is that of the type of a family *Hominidæ* or *Anthropidæ*, the term *Bimana* being used, if at all, as the name of a superfamily or suborder, by means of which man alone is thus contrasted with *Simiæ*.

$$(x+y)^3 = x^3 + 3x^2y + 3xy^2 + y^3$$
$$(x+y)^4 = x^4 + 4x^3y + 6x^2y^2 + 4xy^3 + y^4;$$ or, in general,
$$(x+y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{2.3}$$

Bioplasm . . . moves and grows. . . . It may be correctly called living or forming matter, for by its agency every kind of living thing is made, and without it, as far as is known, no living thing ever has been made; . . . but the most convenient and least objectionable name for it is living plasma or *bioplasm* (*βίος*, life, *πλάσμα*, plasm, that which is capable of being fashioned).

This is the sense in which Sir W. R. Hamilton used the word. He distinguished such a quantity from a real quaternion, because the whole algebraic procedure with complex quaternions is different from and more difficult than that with real quaternions.

2. The ratio of two rotors. This meaning was given to the word by W. K. Clifford, who conceived that Hamilton's biquaternions did not deserve a separate name. In this sense a biquaternion is the sum of two quaternions belonging to different systems, so that their product vanishes.

Not connected with L. *betula*, birch: see *Betula*.] **1.** A tree or shrub belonging to the genus *Betula* (which see). The birches have smooth, laminated outer bark and close-grained wood, which in some species is hard and tough, taking a fine polish, and is used in the manufacture of furniture and for many other purposes. The white, gray, or poplar birch, *Betula alba*, the principal European species, is a small tree, but is put to many uses, especially in the old world. The bark is used for tanning and thatching, and yields an oil which is said to be used to give Russia leather its peculiar odor; spruce-oil is also used for this purpose. The leaves, as well as the sap and oil, are used in the treatment of various chronic diseases, and the wood is used for fuel and many other purposes. Several varieties of this species, as the weeping, cut-leafed, and purple birches, are much cultivated for ornament. The canoe- or paper-birch of North America, *B. papyrifera*, is a large tree with a very tough, durable bark, which is largely used by the Indians in the manufacture of canoes and tents. The timber is valuable. The yellow or gray birch, *B. lutea*, is one of the most important deciduous trees of the northern Atlantic forests, growing to a very large size: its wood is heavy, very strong, and hard. The black, sweet, cherry-, or mahogany-birch, *B. lenta*, has a very spicy, aromatic bark, yielding a volatile oil identical with oil of wintergreen, and its heavy, dark-colored wood is largely used for making furniture and in ship-building. Other prominent species are the red or river-birch, *B. nigra*, of the Southern States, and the black birch, *B. occidentalis*, of the Rocky Mountains and westward. Several shrubby species are widely distributed in mountainous and arctic regions, reaching a higher latitude than any other deciduous tree, as the alpine birch (*B. nana*), the low or dwarf birch (*B. pumila*), and the scrub birch (*B. glandulosa*).

Paul and Timotheus . . . to all the saints in Christ Jesus which are at Philippi, with the *bishops* and deacons.
Philip. i. 1.

The English version has hardly dealt fairly in this case with the sacred text, in rendering ἐπισκόπους, verse 28 (Acts xx.), "overseers"; whereas it ought there, as in all other places, to have been "*bishops*"; that the fact of elders and *bishops* having been originally and apostolically synonymous might be apparent to the ordinary English reader, which now it is not.
Dean Alford, Greek Test., Acts xx. 17.

Bishops and Presbyters, literally overseers and elders, are universally admitted to be terms equivalent to a considerable extent, and often, at least, applied to the same officers. *Smith*, Student's Eccles. Hist., p. 176.

3. From an early time, an overseer over a number of local churches; particularly, in the Greek, Oriental, Roman Catholic, and Anglican churches, the title of the highest order in the ministry. See *episcopacy*. The origin of the office of bishop in the Christian church is a matter of dispute. The terms *bishop* and *presbyter* appear to be used interchangeably in the New Testament; but those who support the episcopal form of government maintain that while these terms were not yet limited to their later meanings a difference of rank was indicated by them, that the office of the apostles, as overseers over the local churches and their pastors, was episcopal in its nature, and that the term *bishop* is appropriately used to designate those whom they ordained as their successors in an office which was intended to be permanent; while those who reject the episcopal form of government hold that the apostolic office was purely personal, and that the apostles had not and could not have successors. The Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church claim an unbroken succession of bishops from apostolic times. Moravian bishops also claim an unbroken episcopal succession, but exercise jurisdiction not as diocesans, but jointly. The first Methodist superintendent, the title afterward superseded by *bishop*, was ordained by Wesley in 1784. (See *itinerant bishop*.) In the Greek, Oriental, and Roman Catholic churches, the different grades of the office, besides *simple* or *ordinary bishop*, are *archbishop*, *metropolitan*, *primate*, *exarch*, and *patriarch*; these were ecclesiastically instituted for convenience of government. (See *pope*.) The Anglican Church also has archbishops and metropolitans. By virtue of concordats, the nomination of Roman Catholic bishops is sometimes made by the temporal power; the former election by the clergy remains in some cathedral chapters, but more commonly names are proposed by the fellow-suffragans and metropolitan, and by the clergy of the diocese to be provided for, to the Pope, who directly appoints and in any case confirms the new bishop. In England bishops are nominated by the sovereign, who, upon request of the dean and chapter for leave to elect a bishop, sends a *congé d'élire*, or license to elect, with a letter missive, nominating the person whom he would have chosen. The election, by the chapter, must be made within twelve days, or the sovereign has a right to appoint whom he pleases. In the Protestant Episcopal Church in the United States the bishops are elected by the clergy and laity. Bishops are said to be *consecrated* rather than *ordained*. *Enthronization* is the solemn installation following the consecration. A bishop changed from one see to another is said to be *translated*; the church containing his cathedra or episcopal throne is called *cathedral*, and the local jurisdiction indicated by this throne, and the city or locality in which this stands, together with the diocese or territory attached to it, his *see*, to which he is said to be *wedded*, and which is *widowed* when deprived of him. This relation is symbolized by the bishop's ring, which in the Western Church is a part of the insignia of his office, together with the miter, staff, and cross. To this office also are applied the term *pontiff* and its derivatives. Twenty-four of the English bishops and the two archbishops are peers of the realm, with seats in the House of Lords, and certain political and judicial or quasi-judicial functions. In the Mormon Church the bishop is an officer of the Aaronic or lesser priesthood, presides over it, ministers in outward ordinances, conducts the temporal business of the church, and acts as judge on transgressors. Often abbreviated *Bp*. See *chorepiscopus* and *vicar apostolic*.

of the principal or cathedral church of his diocese. In the early church, as still in the Greek Church and in some Roman Catholic churches, it stood behind the altar in the apse, and formed the central and highest seat of the synthronus (which see). According to a later arrangement, which continues to be the general rule in Roman Catholic and Anglican cathedrals, it is placed at the extreme east end of the stalls on either (preferably the northern or gospel) side, and is generally separate, but sometimes forms part of the stalls. It is usually of wood, but often of marble or bronze. bismuth (biz′muth), *n.* [= F. *bismuth*, < G. ★*bismuth*, now commonly *wismut*, *wismuth*, orig. *wissmuth*; of mod. (16th century) but unknown origin.] Chemical symbol, Bi; atomic weight, 208; specific gravity, 9.6 to 9.8. A metal of a peculiar light-reddish color, highly crystalline, and so brittle that it can be pulverized. Its crystalline form is rhombohedral, closely approximating that of the cube. It occurs native in imperfect crystallizations, filiform shapes, and disseminated particles, in the crystalline rocks; also as a sulphuret, and in combination with tellurium and some other metals, and in various oxidized combinations. The native metal and the carbonate (bismutite) are the chief important sources of the bismuth of commerce. Until recently, almost the entire supply of the metal came from Schneeberg in Saxony, where it occurs in combination with ores of cobalt, arsenic, and silver. Nearly all the bismuth of commerce contains at least a trace of silver. Bismuth is a remarkable metal in that its specific gravity is diminished, instead of being increased, by pressure. It is the most diamagnetic of the metals. It fuses at a comparatively low temperature (269.2° C.), and is volatilized at a white heat. Alloys of bismuth with tin and lead fuse at a temperature considerably less than that of boiling water. (See *Newton's* and *Rose's metals*, under *metal*.) Alloys of the same metals with the addition of cadmium fuse at still lower temperatures; one prepared by Lipowitz remains perfectly fluid at 63° C. These alloys have been used to some extent for clichés and for stereotyping, but are now of little practical importance. The chief uses of bismuth are as a medicine and as a cosmetic. For these purposes it is prepared in the form of the subnitrate called in the old pharmaceutical language *magisterium bismuthi*. The cosmetic, in preparing which the basic chlorid has also been employed, is known as pearl-powder or blanc d'Espagne. Bismuth has of late years been much experimented with as a possible component of useful alloys, for several of which patents have been issued; but no one of these alloys is known to have come into general use. Bismuth has also been used to a limited extent in the manufacture of highly refractive glass, and of strass (which see). It is used with antimony in the thermo-electric pile or battery. (See *thermo-electricity*.) It has also begun to be used to some extent in the manufacture of porcelain, for the purpose of giving to its surface a peculiar colorless, irised luster, which can also be had of various colors when other metals are used in combination with the bismuth. This metal is one for which the demand is extremely fluctuating, but on the whole increasing; and, as its ores have nowhere been discovered in large quantity, its price has been more variable than that of any other metal, with the possible exception of nickel, running between 55 cents and $5 a pound. The total consumption of the metal is probably between 25 and 50 tons a year, and it comes chiefly from the Erzgebirge (between Saxony and Bohemia), France, South America, and New South Wales. It was called by the alchemists, while in their uncertain condition of knowledge as to its nature, by various names, as *marcasita argentea*, *plumbum cinereum*, *stannum cinereum*, etc.; also called formerly in French *étain de glace*, corrupted in English into *tin-glosse*.—**Bismuth-blende**, the mineral eulytite (which see).—**Bismuth-glance**, an ore of bismuth. *Prismatic bismuth-glance* is a sulphid of bismuth or bismuthinite, and *acicular bismuth-glance* is the same as *needle-ore* or *aikinite*.—**Bismuth ocher**, the mineral bismite.—**Bismuth silver.** See *argentobismutite*.—**Butter of bismuth**, an old name for the chlorid of bismuth.—**Flowers of bismuth**, a yellow-colored oxid formed by the sublimation of bismuth.—**Magistery of bismuth**, the subnitrate or basic nitrate of bismuth.—**Telluric bismuth**, the mineral tetradymite.

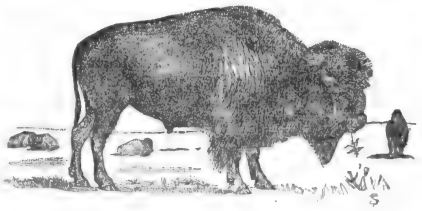
It formerly extended into some of the Atlantic States, as Virginia; the contraction of the area of its habitat and the reduction of its numbers have gone on steadily with the advance of European occupation; the construction of the Union Pacific railroad cut the great herd in two, leaving a southern or Texan herd, chiefly in the region of the Staked Plains, and a northern or Yellowstone or Saskatchewan herd, in the region of the upper Missouri and northward. The animal resembles the aurochs (which see), but is considerably smaller; the hump is very high and large; the hind quarters are light; the tail is about



American Bison (*Bison americanus*).

20 inches long, ending in a wisp of hairs of about 6 inches additional; the horns, especially in the male, are short, thick, and much curved; the head is carried very low; the long shaggy hair of the fore parts sometimes sweeps the ground; the color is blackish in fresh pelages, more brown or gray in worn ones and in aged individuals; the calves are reddish. Formerly the hair-covered skins were much used as robes, but only the cows were killed for them, the hides of the bulls being not easily manageable. In summer, after shedding its hair, the animal is nearly naked.

plied to those years which have 366 days, the extra day being inserted in the month of February. See *bissextus*. This occurs every fourth year, taken as each year of which the number is divisible by 4 without remainder. Inasmuch, however, as a year of 365¼ days exceeds the true length of a solar astronomical year by 11 minutes and 14 seconds, amounting to an error of a day in 128 years, it was provided in the Gregorian calendar that the intercalary day should be omitted in all centenary years except those which are multiples of 400.

II. *n.* A leap-year (which see).

bissextus (bi-seks′tus), *n.* [L.: see *bissext*, and cf. *bissextile*.] The extra or intercalary day inserted by the Julian calendar in the month of February every fourth year, in order to make up the six hours by which (it was reckoned) the natural or solar year exceeds the common year of 365 days. This extra day was provided for by reckoning twice the sixth day before the calends (or first) of March (or the sixth day from the calends of March, both days included, reckoning backward from the succeeding month, as was the custom of the Romans), the "sixth" (or first sixth) day proper thus corresponding to February 25th, according to our reckoning, and the extra sixth, or "second sixth," to our February 24th. Since 1662, when the Anglican liturgy was revised, the 29th day of February has been, more conveniently, regarded as the intercalated day in all English-speaking countries. In the ecclesiastical calendars of the countries of continental Europe, however, the 24th day of February is still reckoned as the bissextus or intercalary day.
